AERIS Expert Review Packet

Anomaly

Source / metric	tceq / co
Observed / expected	0.5 / 0.136957
Time	2026-07-29 17:00 UTC
Location	29.7337, -95.2576
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	9 / 865	40.37 to 100; mean 72.9254	59.12 at 2026-07-29 16:55Z; dt 5 min
asos	temperature	degC	9 / 865	22.7778 to 36.1111; mean 29.651	32 at 2026-07-29 16:55Z; dt 5 min
asos	wind_direction	degree	9 / 1160	0 to 270; mean 163.543	190 at 2026-07-29 16:55Z; dt 5 min
asos	wind_speed	m/s	9 / 1212	0 to 7.71666; mean 2.8498	2.05778 at 2026-07-29 16:55Z; dt 5 min
noaa_gfs	gh_500	m	10 / 120	5909.24 to 5941.31; mean 5927.82	5928.39 at 2026-07-29 18:00Z; dt 60 min
noaa_gfs	pbl_height	m	10 / 120	48.9097 to 2294.53; mean 860.215	2188.77 at 2026-07-29 18:00Z; dt 60 min
noaa_gfs	precipitable_water	mm	10 / 120	34.4259 to 49.1773; mean 40.4243	43.2396 at 2026-07-29 18:00Z; dt 60 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 36

The TCEQ monitor 482011035 recorded a carbon monoxide concentration of 0.5 ppm at 2026-07-29T17:00:00+00:00, which is a severe positive anomaly relative to the expected value of about 0.137 ppm at that site and time.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 2 of 36

Heavy urban mobile source emissions from surrounding traffic corridors accumulated locally and were transported toward the monitor by light southerly surface winds reported by ASOS and OpenWeather.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 3 of 36

Southerly to south-southwesterly near-surface winds of roughly 2 to 3 m/s at the anomaly time could have transported a localized combustion plume from sources south of the monitor toward the site without producing a broad regional pollution episode.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 4 of 36

Surface meteorology near the anomaly featured southerly to south-southwesterly winds of about 2 to 2.4 m/s and a deep afternoon planetary boundary layer near 2189 m, which supports transport of a nearby plume to the monitor but does not support strong regional stagnation or shallow-trapping accumulation.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 5 of 36

TCEQ surface monitors and OpenAQ sensors recorded simultaneous elevations in carbon monoxide reaching 0.5 ppm, PM10 reaching 120 ug/m3, and NO2 reaching 10.5 ppb at 2026-07-29T17:00:00+00:00, supporting a localized industrial or combustion emission source.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 6 of 36

The temperature was unusually high on July 29th, which could have contributed to the formation of ground-level ozone.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 7 of 36

Sentinel-5P satellite observations recorded standard baseline total CO column values of approximately 0.0256 mol/m^2 over the area, indicating that the TCEQ carbon monoxide spike was isolated to the surface boundary layer rather than a widespread regional plume.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 8 of 36

Localized industrial combustion or flaring events in eastern Houston released primary pollutants, causing concurrent elevated levels of carbon monoxide, nitrogen dioxide, and particulate matter recorded by TCEQ and OpenAQ sensors.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 9 of 36

The anomaly occurred on July 29th at around 17:01:54 UTC, with the nearest sensor located approximately 14.451 km away from the anomaly.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 10 of 36

Light winds and stable surface microscale conditions prior to full planetary boundary layer expansion contributed to the localized accumulation of primary combustion emissions, as modeled in GFS data.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 11 of 36

The concentration of PM2.5 is elevated to 8.3 ug/m3, which is above the mean value of 8.0665 ug/m3.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 12 of 36

The pollutant showing the anomaly is carbon monoxide measured by tceq.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 13 of 36

The air-quality anomaly in Houston, Texas on July 29th was caused by a combination of factors including high temperatures, low wind speeds, and nearby industrial activities.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 14 of 36

The tceq carbon monoxide anomaly is consistent with a localized primary combustion plume because the anomalous monitor measured 0.5 ppm at 17:00 UTC while other nearby tceq carbon monoxide monitors within about 15 km had lower period means of 0.1156 to 0.3532 ppm and the coincident tceq nitrogen dioxide value at the same monitor was elevated at 10.5 ppb, which is a typical co-emitted combustion tracer.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 15 of 36

Sentinel-5P satellite retrievals showed a stable regional CO column density near 0.0265 mol/m2 on July 29, 2026, indicating the anomaly was limited to the surface layer.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 16 of 36

The air quality in Houston, Texas is poor due to high levels of SO2.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 17 of 36

NO2 levels were also elevated in Houston, Texas on July 29th, suggesting increased emissions from industrial or vehicular sources.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 18 of 36

OpenAQ sensors co-located near the anomaly reported elevated PM10 concentrations reaching 120.0 ug/m3 at 17:00 UTC on July 29, 2026.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 19 of 36

A severe carbon monoxide concentration of 0.5 ppm was recorded at coordinates (29.734, -95.258) on July 29, 2026, at 17:00 UTC, significantly exceeding the expected baseline value of 0.137 ppm.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 20 of 36

Nitrogen dioxide concentration measured 10.5 ppb at the primary anomaly monitor location on July 29, 2026, at 17:00 UTC.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 21 of 36

Meteorology from asos, openweather, and gfs supports transport of a localized plume rather than strong stagnation because near the anomaly winds were southerly to south-southwesterly at about 190 to 208 degrees with speeds around 2.1 to 2.4 m/s and the afternoon boundary layer was deep at about 2189 m, allowing advection from upwind source areas while not favoring citywide surface accumulation.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 22 of 36

A region-wide CO accumulation event or wildfire-smoke-driven anomaly is less plausible because daytime boundary-layer depth was high, no precipitation-related stagnation signal was present, satellite CO column was not elevated over the area, and surface PM2.5 remained only modestly elevated even though one nearby PM10 sensor was high.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 23 of 36

TCEQ monitor 482011035 recorded a carbon monoxide concentration of 0.5 ppm alongside an NO2 level of 10.5 ppb at 17:00 UTC on July 29, 2026.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 24 of 36

The data contradict a regional smoke or widespread secondary-pollution explanation because sentinel5p showed a relatively low local carbon monoxide column on 2026-07-29 compared with the adjacent days, ozone near the monitor was only 0.018 ppm, and purpleair and openaq fine-particle levels were modest near the event even though one collocated openaq PM10 sensor was high, indicating a near-source coarse or mixed local plume rather than regional smoke.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 25 of 36

The air quality in Houston, Texas is poor due to high levels of NO2.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 26 of 36

The air quality in Houston, Texas is poor due to high levels of PM2.5.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 27 of 36

The tceq carbon monoxide measurement at coordinates (29.734, -95.258) was 0.5 ppm at 2026-07-29T17:00:00+00:00.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 28 of 36

A short-lived local combustion source near the Houston monitor, such as industrial process emissions, flaring-related combustion, heavy-duty traffic, or nonroad equipment, is the most plausible physical cause of the severe CO spike because the CO enhancement was large at one TCEQ site while co-pollutants remained only modestly elevated or low at that location.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 29 of 36

The pollutant responsible for the anomaly is PM2.5.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 30 of 36

The wind direction and speed on July 29th were conducive to the accumulation of pollutants in the area, leading to the observed air-quality anomaly.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 31 of 36

ASOS surface stations and OpenWeather data reported light south-southwesterly winds around 2.0 m/s during the anomaly, providing weak atmospheric dispersion that allowed localized primary pollutants to accumulate near ground level.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 32 of 36

The PM2.5 levels exceeded the normal range in Houston, Texas on July 29th, indicating a significant increase in particulate matter in the air.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 33 of 36

Coinciding with the carbon monoxide spike on July 29, 2026, at 17:00 UTC, PM10 and PM2.5 concentrations reached 120.0 ug/m3 and 15.7 ug/m3 respectively at a location 0.021 km from the anomaly.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 34 of 36

Regional observations do not support a broad wildfire-smoke or region-wide CO buildup event because Sentinel-5P CO column near Houston was not elevated on 2026-07-29, while the anomalous site simultaneously showed elevated NO2 and high local PM10 consistent with a localized fresh combustion plume.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 35 of 36

The tceq carbon monoxide measurement of 0.5 ppm at 2026-07-29T17:00:00+00:00 exceeded the expected value of 0.13695652173913042 ppm with a z-score of 6.145967130068515, and the anomaly was labeled severe.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Claim 36 of 36

A nearby industrial facility may have released excessive amounts of sulfur dioxide and nitrogen oxides into the atmosphere, causing the air-quality anomaly.

Mark exactly one:	[ ] V	[ ] I	[ ] U

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
