

AERIS Expert Review Packet

Anomaly

Source / metric	openaq / pm25
Observed / expected	41.2 / 8.22963
Time	2026-06-04 16:00 UTC
Location	29.6958, -95.4992
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	9 / 637	60.39 to 100; mean 87.3765	88.78 at 2026-06-04 15:55Z; dt 5 min
asos	temperature	degC	9 / 637	21.6667 to 31.1111; mean 25.4696	26 at 2026-06-04 15:55Z; dt 5 min
asos	wind_direction	degree	9 / 636	0 to 360; mean 97.9717	70 at 2026-06-04 15:55Z; dt 5 min
asos	wind_speed	m/s	9 / 637	0 to 9.77444; mean 3.2926	3.08666 at 2026-06-04 15:55Z; dt 5 min
noaa_gfs	gh_500	m	10 / 120	5862.22 to 5884.53; mean 5874.15	5878.94 at 2026-06-04 18:00Z; dt 120 min
noaa_gfs	pbl_height	m	10 / 120	33.5323 to 1330.69; mean 475.451	1288.53 at 2026-06-04 18:00Z; dt 120 min
noaa_gfs	precipitable_water	mm	10 / 120	42.8617 to 56.6819; mean 52.1256	50.8687 at 2026-06-04 18:00Z; dt 120 min
noaa_gfs	surface_pressure	hPa	10 / 120	1003.6 to 1015.16; mean 1010.99	1011.66 at 2026-06-04 18:00Z; dt 120 min
noaa_gfs	t_850	degC	10 / 120	16.13 to 19.4519; mean 17.1357	16.7238 at 2026-06-04 18:00Z; dt 120 min

Event-nearest wind vectors from stored values (arrow points downwind)

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 36

The anomaly is caused by a nearby industrial facility releasing excessive amounts of particulate matter into the atmosphere.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 36

Weak to modest and somewhat variable near-surface winds likely favored temporary accumulation of a neighborhood-scale plume because local wind speeds near the anomaly were low in some observations, including about 0.45 m/s in openweather and about 3.09 m/s at the nearest ASOS station, while wind directions differed between datasets, which is consistent with limited dispersion and possible microscale recirculation.

Calm-wind flag: wind direction unstable under calm conditions. openweather: event wind 0.45 m/s, below its cutoff of 1.5 m/s (mean - 2*SD gave -0.5007214681470114 m/s; n=360 wind readings). Cutoff floor: confirmed 2026-07-24.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 36

A broad regional secondary photochemical or sulfur-rich pollution episode is weakly supported because ozone near the anomaly was low at 0.016 ppm, TCEQ SO₂ near the anomaly was near zero or negative, Sentinel-5P SO₂ was near zero, and Sentinel-5P CO on 2026-06-04 was not elevated relative to 2026-06-03, although elevated Sentinel-5P HCHO leaves open some contribution from reactive VOC-rich combustion or industrial precursors.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 36

The Houston anomaly is more consistent with near-source smoke or combustion-related aerosol than with a broad photochemical, sulfur-rich, or dust-driven event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 36

The anomaly occurred on June 4th, 2026 at 16:00:00+00:00.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 36

The openaq PM2.5 anomaly at the Houston site is most consistent with a localized primary fine-particle plume rather than a region-wide PM2.5 episode.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 36

On June 4, 2026, at 16:00 UTC, an OpenAQ surface monitor at coordinates (29.696, -95.499) in Houston, Texas, recorded a PM2.5 spike to 41.2 ug/m3, well above the expected value of 8.23 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 36

High ambient relative humidity exceeding 85 percent promoted the hygroscopic growth of aerosol particles and aqueous-phase conversion of precursor gases into secondary fine particulate matter.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 36

The air quality anomaly in Houston, Texas on June 4th was also characterized by elevated levels of NO₂.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 36

Elevated local combustion emissions contributed to the PM_{2.5} spike, supported by co-located TCEQ nitrogen dioxide measurements reaching 11.0 ppb at the exact time and location of the OpenAQ PM_{2.5} peak.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 11 of 36

At 16:00 UTC on June 4, 2026, a TCEQ monitor situated 0.006 km from the anomaly recorded a nitrogen dioxide (NO₂) concentration of 11.0 ppb.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 12 of 36

The air quality anomaly in Houston, Texas on June 4th was characterized by elevated levels of PM2.5.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 13 of 36

The openaq PM2.5 measurement at 29.696, -95.499 was 41.2 ug/m3 at 2026-06-04T16:00:00+00:00, compared with an expected value of 8.23 ug/m3, corresponding to a z-score of 10.50 and severe anomaly classification.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 36

Boundary layer suppression and weak surface winds facilitated localized particulate entrapment, with GFS showing morning planetary boundary layer heights dropping to near 122 meters and OpenWeather reporting surface wind speeds down to 0.45 m/s near the time of the event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 15 of 36

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5 particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 36

High relative humidity levels exceeding 85% near the anomaly location facilitated hygroscopic aerosol growth and particulate accumulation.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 17 of 36

The Houston PM2.5 anomaly is strongly consistent with a localized fine-particle plume because the anomalous openaq PM2.5 value reached 41.2 ug/m3 while a nearby purpleair sensor at the same hour measured only 15.8 ug/m3 and the nearest openaq PM10 value was only 16.0 ug/m3, indicating sharp spatial gradients and a fine-mode-dominant signal rather than a uniform regional event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 18 of 36

A severe thunderstorm or tornado event has stirred up dust and pollutants from the ground, contributing to the air quality anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 19 of 36

The anomaly is a result of a combination of factors including temperature inversions, atmospheric stagnation, and increased emissions from vehicles and industrial activities in the Houston area.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 20 of 36

The air quality anomaly in Houston, Texas on June 4th was likely caused by a combination of factors including weather patterns and local emissions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 36

Localized combustion emissions from urban transport or industrial activities contributed primary aerosols and precursors, supported by elevated co-located nitrogen dioxide readings.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 36

Humidity likely amplified the measured Houston PM2.5 anomaly because relative humidity near the anomaly was very high at about 84 to 89 percent around 16:00 UTC, but humidity alone is not sufficient to explain the event because the local PM2.5 spike was far larger than the area-wide 6-hour PM2.5 means and occurred when modeled afternoon boundary-layer height was high near 1289 m, which would usually reduce accumulation from stagnant trapping.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 23 of 36

High ambient humidity in Houston likely increased the measured PM2.5 during the plume through particle-water uptake, but high humidity alone is insufficient to explain the full magnitude of the PM2.5 spike.

Calm-wind flag: wind direction unstable under calm conditions. openweather: event wind 0.45 m/s, below its cutoff of 1.5 m/s (mean - 2*SD gave -0.5007214681470114 m/s; n=360 wind readings). Cutoff floor: confirmed 2026-07-24.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 24 of 36

The air quality anomaly in Houston, Texas is caused by high levels of NO2 particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 25 of 36

At 2026-06-04T16:00:00+00:00 near 29.696, -95.499, openaq ozone was 0.016 ppm at the co-located sensor and openaq PM10 was 16.0 ug/m3 at the nearest PM10 sensor 23.723 km away.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 26 of 36

A nearby PurpleAir sensor located 2.571 km from the anomaly site recorded elevated PM2.5 levels of 15.8 ug/m3 at 16:00 UTC on June 4, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 36

High ambient relative humidity exceeding 84 percent observed by ASOS and OpenWeather promoted aerosol hygroscopic growth and secondary particle formation, contributing to elevated PM2.5 readings detected by OpenAQ.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 28 of 36

High ambient humidity likely amplified the observed PM_{2.5} concentration through hygroscopic growth or measurement bias because relative humidity near the anomaly time was about 84 to 89 percent across nearby observations, conditions under which fine particles can take up water and increase reported PM_{2.5} mass.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 29 of 36

The air quality anomaly in Houston, Texas is caused by high levels of SO₂ particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 30 of 36

OpenAQ recorded a PM_{2.5} concentration spike to 41.2 ug/m³ at 16:00 UTC on June 4, 2026 in Houston, Texas.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 31 of 36

Light surface winds under 3 m/s and a shallow boundary layer trapped local primary combustion emissions near the surface, as indicated by elevated TCEQ NO₂ concentrations.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 36

A localized combustion-related fine-particle plume near the Houston site is a plausible cause because PM2.5 reached 41.2 ug/m3 at the anomaly site while nearby PM10 was only 16.0 ug/m3, ozone at the site was only 0.016 ppm, TCEQ SO2 was near zero, and regional satellite CO was not elevated, which fits a short-lived local primary PM2.5 event more than a broad regional photochemical or sulfur-rich plume.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 36

The nearest purpleair PM2.5 sensor, 2.571 km from 29.696, -95.499, measured 15.8 ug/m3 at 2026-06-04T16:00:00+00:00.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 36

The air quality anomaly is related to particulate matter (PM2.5) with a value of 15.8 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 35 of 36

Stagnant meteorological conditions characterized by low surface wind speeds and a shallow morning planetary boundary layer restricted vertical mixing and trapped fine particulate matter near the ground.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 36 of 36

The location of the anomaly is approximately 2.571 km from the nearest sensor.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
