

AERIS Expert Review Packet

Anomaly

Source / metric	tceq / co
Observed / expected	0.4 / 0.105405
Time	2026-07-30 19:00 UTC
Location	29.6697, -95.1285
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	7 / 712	39 to 100; mean 71.9373	49.74 at 2026-07-30 18:55Z; dt 5 min
asos	temperature	degC	7 / 712	23.3333 to 36.1111; mean 29.7995	34 at 2026-07-30 18:55Z; dt 5 min
asos	wind_direction	degree	7 / 875	0 to 280; mean 166.114	140 at 2026-07-30 18:55Z; dt 5 min
asos	wind_speed	m/s	7 / 925	0 to 8.2311; mean 2.8742	2.05778 at 2026-07-30 18:55Z; dt 5 min
noaa_gfs	gh_500	m	8 / 96	5909.24 to 5954.66; mean 5936.32	5940.05 at 2026-07-30 18:00Z; dt 60 min
noaa_gfs	pbl_height	m	8 / 96	48.9097 to 2294.53; mean 829.728	1709.36 at 2026-07-30 18:00Z; dt 60 min
noaa_gfs	precipitable_water	mm	8 / 96	35.2236 to 49.1773; mean 41.2854	41.3172 at 2026-07-30 18:00Z; dt 60 min
noaa_gfs	surface_pressure	hPa	8 / 96	1007.06 to 1015.13; mean 1011.47	1012.71 at 2026-07-30 18:00Z; dt 60 min
noaa_gfs	t_850	degC	8 / 96	18.5842 to 22.3746; mean 20.7409	19.0563 at 2026-07-30 18:00Z; dt 60 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 36

Surface weather observations from ASOS stations recorded light south-southeasterly winds under 4 m/s during the anomaly window, which restricted local atmospheric dispersion.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 36

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 36

The PM2.5 levels exceeded the normal range in Houston, Texas on July 30th, with a peak value of 1.625 ug/m3 at sensor 128007.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 36

At 2026-07-30T19:00:00+00:00 at 29.670, -95.129, the nearest reported co-pollutant values were 1.3 ppb for tceq nitrogen dioxide, 0.1 ppb for tceq sulfur dioxide, 0.033 ppm for openaq ozone, 22.0 ug/m3 for openaq PM10, and 8.2 ug/m3 for openaq PM2.5.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 36

The air quality anomaly in Houston, Texas is not caused by changes in wind direction or speed.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 36

A local primary combustion plume is supported because the TCEQ CO monitor at 29.670, -95.129 measured 0.4 ppm at 2026-07-30T19:00:00+00:00 versus an expected 0.105 ppm, while co-located TCEQ NO2 was only 1.3 ppb, co-located TCEQ SO2 was 0.1 ppb, nearby OpenAQ PM2.5 was 8.2 ug/m3, nearby OpenAQ PM10 was 22 ug/m3, and nearby OpenAQ ozone was 0.033 ppm rather than showing a parallel spike in multiple pollutants.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 36

A large regional smoke or urban-scale accumulation event is less likely as the primary cause of the CO spike because satellite CO column near Houston on 2026-07-30 was only modestly elevated relative to adjacent days, satellite SO₂ and NO₂ columns were not strongly enhanced, and local particle measurements remained low to moderate rather than showing the widespread PM increase expected from regional smoke.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 36

Low co-located nitrogen dioxide concentrations observed by TCEQ alongside modest fine particulate matter readings from OpenAQ and PurpleAir indicate that the carbon monoxide anomaly was not caused by a major regional combustion or wildfire event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 36

The air quality anomaly in Houston, Texas on July 30th was caused by a combination of factors including high temperatures, low wind speeds, and nearby industrial activities.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 36

Local surface wind speeds were measured between 2.0 and 3.8 m/s while the boundary layer height reached approximately 1650 to 1700 meters during the afternoon of July 30, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 11 of 36

The localized peak in surface carbon monoxide of 0.4 ppm recorded by TCEQ monitor 482011039, contrasted with baseline total column atmospheric CO concentrations measured by Sentinel-5P, points to a primary ground-level emission source near the monitor.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 12 of 36

At the exact time of the carbon monoxide anomaly, adjacent air quality monitoring recorded an ozone concentration of 0.033 ppm and a PM2.5 concentration of 8.2 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 13 of 36

Sentinel-5P total column CO measurements and surface PM2.5 sensor networks showed stable, low concentrations across the Houston area, confirming the localized nature of the CO anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 36

The tceq carbon monoxide value of 0.4 ppm at 2026-07-30T19:00:00+00:00 at monitor 482011039 exceeded the mean carbon monoxide level of 0.1188 ppm for that monitor over the provided context window.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 15 of 36

The carbon monoxide concentration at the monitor location reached 0.4 ppm compared to an expected baseline of approximately 0.105 ppm, corresponding to a z-score of 8.55.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 36

A carbon monoxide concentration of 0.4 ppm was recorded at the TCEQ monitoring station at coordinates (29.670, -95.129) on July 30, 2026, at 19:00 UTC.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 17 of 36

Surface and boundary-layer meteorology near Houston at the anomaly time supported transport of a narrow plume from the south to southeast toward the monitor rather than regional accumulation, because nearby observed winds were about 140 degrees at 2.06 m/s and modeled daytime planetary boundary layer height was about 1709 m.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 18 of 36

Heavy vehicular traffic emissions along nearby transportation corridors, such as State Highway 225, contributed directly to the elevated carbon monoxide concentrations recorded at the surface.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 19 of 36

The air quality anomaly is related to PM2.5 levels.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 20 of 36

Meteorological transport from a source to the south or southeast of the monitor is supported because the nearest ASOS station reported 140 degree wind direction and 2.06 m/s wind speed within 5 minutes of the anomaly, the ASOS 18Z mean wind direction was about 181 degrees, and GFS 10 m winds near the site were positive u and v at 18Z, indicating southerly to southeasterly flow capable of carrying a narrow plume across the monitor.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 36

The air quality anomaly in Houston, Texas is not caused by high levels of CO, NO₂, SO₂, or CH₄.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 36

The NO₂ levels were also elevated in Houston, Texas on July 30th, with a peak value of 22.7 ppb at monitor 482011039.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 23 of 36

The PM_{2.5} levels are elevated at 1.1 ug/m³, which is higher than the mean of 8.1319 ug/m³.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 24 of 36

The anomaly occurred on July 30th at around 18:58:49 UTC.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 25 of 36

The wind direction and speed anomalies are caused by a low-pressure system.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 26 of 36

The TCEQ monitor at 29.670, -95.129 measured a severe local CO spike of 0.4 ppm at 2026-07-30T19:00:00+00:00 against an expected value near 0.105 ppm, while the same site measured only 1.3 ppb NO2 and 0.1 ppb SO2 at that time.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 36

The PM2.5 levels are elevated due to nearby industrial activities or wildfires.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 28 of 36

Industrial combustion or process flaring at petrochemical facilities along the Houston Ship Channel corridor released a localized carbon monoxide plume, causing the TCEQ monitor to record 0.4 ppm at 19:00 UTC on July 30, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 29 of 36

Local meteorology could have allowed a narrow source plume to intersect the monitor at 19 UTC because surface conditions were hot and relatively dry with light-to-moderate winds near the site, with ASOS reporting about 34 C, 49.74 percent humidity, wind from 140 degrees at 2.06 m/s near the anomaly time, while GFS showed southerly low-level flow and a daytime planetary boundary layer near 1709 m that would favor advection of a discrete plume rather than stagnant nighttime accumulation.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 30 of 36

The temperature anomaly is caused by a heatwave.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 31 of 36

A severe carbon monoxide concentration anomaly was detected on July 30, 2026, at 19:00 UTC at location (29.670, -95.129).

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 36

Regional stagnation or a large area combustion episode is contradicted because GFS planetary boundary layer height near the site was about 1709 m at 18Z, surface winds were not calm in ASOS and OpenWeather observations, Sentinel-5P CO column near the site was only 0.02744 mol/m² without an obvious jump relative to adjacent days, and particle measurements from OpenAQ and PurpleAir were not broadly elevated at the anomaly time.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 36

A nearby fresh combustion source such as on-road traffic, diesel equipment, marine or rail activity, or an industrial combustion plume is the leading physical explanation for the sharp CO enhancement because the TCEQ CO monitor at the anomaly site reached 0.4 ppm while colocated NO₂ was only 1.3 ppb, SO₂ was 0.1 ppb, PM_{2.5} was 8.2 ug/m³, PM₁₀ was 22 ug/m³, and ozone was 0.033 ppm, which is consistent with a localized CO-rich plume rather than a broad regional pollution episode.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 36

The tceq carbon monoxide monitor at 29.670, -95.129 recorded 0.4 ppm at 2026-07-30T19:00:00+00:00, compared with an expected value of 0.1054054054054054 ppm, corresponding to a z-score of 8.550663492024825 and a severe anomaly classification.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 35 of 36

The air-quality pattern near 29.670, -95.129 at 2026-07-30 19:00 UTC is most consistent with a short-lived local combustion plume because nearby ozone was 0.033 ppm, nearby PM10 was 22 ug/m3, nearby PM2.5 was 8.2 ug/m3, and broader regional PM2.5 remained modest rather than showing a coincident widespread smoke or aerosol event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 36 of 36

Light surface wind speeds under 4 m/s restricted horizontal dispersion, facilitating the localized buildup of carbon monoxide emissions near the surface.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
