

AERIS Expert Review Packet

Anomaly

Source / metric	openaq / ozone
Observed / expected	0.063 / 0.0156194
Time	2026-06-28 23:00 UTC
Location	29.7681, -95.2206
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	9 / 884	45.96 to 96.77; mean 73.8835	59.12 at 2026-06-28 22:55Z; dt 5 min
asos	temperature	degC	9 / 884	23.3333 to 35; mean 29.582	32 at 2026-06-28 22:55Z; dt 5 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 35

Regional photochemical ozone production is strongly supported because eastern Houston was hot, nearly cloud-free, and dry enough for efficient photochemistry at the anomaly time, with about 32 to 33.1 degrees Celsius temperature, about 59 to 65 percent relative humidity, zero precipitation, and 0 percent cloud cover near 23:00 UTC on 2026-06-28.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 35

Deep daytime boundary layer mixing exceeding 1700 meters combined with southeasterly winds near 6 m/s facilitated the dispersion and reaction of ozone precursor emissions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 35

The PM2.5 levels are elevated, with a mean of 8.9685 ug/m3 and a maximum value of 65.4 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 35

The increase in PM2.5 levels over the past 24 hours is a likely cause of the air quality anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 35

The openaq ozone monitor at eastern Houston recorded 0.063 ppm at 2026-06-28T23:00:00+00:00, which was far above the site's expected 0.0156 ppm and above the context-window mean of 0.0168 ppm, indicating an exceptional local ozone enhancement.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 35

Deep planetary boundary layer growth reaching over 1,700 meters during the afternoon promoted vertical atmospheric mixing of ozone and precursor species.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 35

The ozone anomaly at 29.768, -95.221 had an expected value of 0.015619354838709677 ppm and a z-score of 7.3617484853196045, which was classified as severe by openaq.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 35

The openaq sensor at 29.768, -95.221 recorded ozone of 0.063 ppm at 2026-06-28T23:00:00+00:00.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 35

A fresh primary combustion or sulfur-rich industrial plume is contradicted because the anomaly coincided with low co-pollutant indicators, including carbon monoxide near 0.1 ppm, nitrogen dioxide near 3.4 ppb, sulfur dioxide near -0.2 ppb, and no satellite enhancement of sulfur dioxide or carbon monoxide over the area on the same afternoon.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 35

NO2 levels are also significantly higher than normal during this period.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 11 of 35

Deep vertical mixing within a daytime planetary boundary layer reaching over 1,700 meters facilitated the photochemical accumulation of surface ozone prior to the evening boundary layer transition.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 12 of 35

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 13 of 35

Southerly to southeasterly winds on 2026-06-28 were consistent with transport of ozone and its precursors from the Houston Ship Channel, petrochemical corridor, and coastal urban-industrial areas toward the anomaly location in eastern Houston.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 35

The openaq ozone context within 50 km from 2026-06-27T11:00:00+00:00 to 2026-06-30T11:00:00+00:00 ranged from -0.001 ppm to 0.069 ppm with a mean of 0.0168 ppm, placing the 0.063 ppm reading near the top of observed values in the window.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 15 of 35

The anomaly occurred on June 28th, with the highest PM2.5 levels recorded at 23:00:01+00:00.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 35

OpenAQ recorded a severe surface ozone anomaly of 0.063 ppm in Houston, Texas at 23:00 UTC on June 28, 2026.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 17 of 35

The air quality anomaly is related to PM2.5 levels.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 18 of 35

A severe surface ozone anomaly occurred at coordinates (29.768, -95.221) in Houston, Texas, on 2026-06-28 at 23:00:00 UTC.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 19 of 35

Hot temperatures, very low cloud cover, no precipitation, and a deep afternoon boundary layer on 2026-06-28 favored strong photochemical ozone production near eastern Houston.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 20 of 35

Clear skies with near-zero cloud cover and afternoon temperatures exceeding 32°C created optimal conditions for photochemical ozone formation on June 28, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 35

High solar irradiance under near-zero cloud cover and ambient temperatures exceeding 32 °C accelerated photochemical ozone formation during the afternoon of June 28, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 35

Nearby trace-gas observations do not support a fresh combustion or sulfur-rich plume as the dominant cause because contemporaneous TCEQ measurements near the anomaly were about 0.1 ppm CO, 3.4 ppb NO₂, and -0.2 ppb SO₂, so the most likely cause is secondary photochemical ozone formed upwind and transported into eastern Houston.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 23 of 35

The recorded ozone concentration reached 0.063 ppm at 2026-06-28T23:00:00+00:00, significantly exceeding the expected baseline value of approximately 0.0156 ppm with a z-score of 7.36.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 24 of 35

High surface temperatures exceeding 32 degrees Celsius combined with near-zero cloud cover on the afternoon of June 28, 2026, provided conditions for rapid photochemical ozone production.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 25 of 35

The air quality anomaly in Houston, Texas is caused by high levels of CO.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 26 of 35

Prevailing southeasterly surface winds transported nitrogen dioxide and other chemical precursors across the region toward the anomaly site.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 35

The air quality anomaly in Houston, Texas is caused by low wind speeds.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 28 of 35

The wind direction and speed changes over the past 24 hours may have contributed to the air quality anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 29 of 35

The temperature increase in the past 24 hours is a contributing factor to the air quality anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 30 of 35

The air quality anomaly in Houston, Texas is characterized by elevated levels of PM2.5.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 31 of 35

The combination of high PM_{2.5} and NO₂ levels is likely the primary cause of the air quality anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 35

Southeasterly winds transported nitrogen oxide precursors across the local area, sustaining photochemical ozone production.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 35

Meteorology near eastern Houston at the anomaly time favored strong ozone production because air temperatures were about 32–33 C, cloud cover was 0%, precipitation was absent, surface winds were from the south to southeast at roughly 3.6–6.7 m/s, and GFS boundary-layer height near 00Z was about 1407 m.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 35

The ozone anomaly is less consistent with a fresh local combustion plume and more consistent with aged photochemical air or recirculated air because co, no2, and so2 near the event were low while ozone was strongly elevated.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 35 of 35

Transport of an ozone-rich precursor-aged air mass into eastern Houston is supported because surface winds near the anomaly were southerly to southeasterly at about 137 to 160 degrees with moderate speeds of about 3.6 to 6.7 meters per second, which is consistent with advection from the Gulf and ship-channel corridor rather than stagnation.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
