

AERIS Expert Review Packet

Anomaly

Source / metric	tceq / so2
Observed / expected	3.1 / -0.484828
Time	2026-07-19 16:00 UTC
Location	29.6240, -95.4743
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	9 / 840	37.3 to 100; mean 74.9209	70.35 at 2026-07-19 15:55Z; dt 5 min
asos	temperature	degC	9 / 840	22 to 37; mean 29.4469	30 at 2026-07-19 15:55Z; dt 5 min
asos	wind_direction	degree	9 / 1120	0 to 320; mean 160.071	200 at 2026-07-19 15:55Z; dt 5 min
asos	wind_speed	m/s	9 / 1165	0 to 8.74555; mean 2.4283	2.05778 at 2026-07-19 15:55Z; dt 5 min
noaa_gfs	gh_500	m	11 / 132	5918.94 to 5946.98; mean 5930.45	5926.69 at 2026-07-19 18:00Z; dt 120 min
noaa_gfs	pbl_height	m	11 / 132	64.8946 to 1860.78; mean 655.241	1356.63 at 2026-07-19 18:00Z; dt 120 min
noaa_gfs	precipitable_water	mm	11 / 132	29.224 to 47.063; mean 36.6002	36.0176 at 2026-07-19 18:00Z; dt 120 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 35

The air quality anomaly in Houston, Texas is not caused by changes in temperature.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 35

The PM2.5 levels are elevated at 8.3 ug/m3, which is higher than the mean of 9.2691 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 35

The weather conditions on July 19th, including high pressure and light winds, contributed to the air quality anomaly in Houston, Texas.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 35

The pollutant showing the anomaly is sulfur dioxide measured by a TCEQ monitor.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 35

A monitor-specific artifact remains a viable alternative because the provided SO₂ network includes only three TCEQ monitors within 50 km and the two other SO₂ monitors have different site means and no explicit simultaneous co-spike reported at 2026-07-19 16:00 UTC, so independent spatial corroboration for the exact event is limited in the current dataset.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 35

A monitor-specific measurement artifact or ultra-local nonregional SO₂ source remains a plausible alternative explanation because Sentinel-5P did not show a matching broad SO₂ column enhancement over the area later that afternoon.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 35

Boundary layer dynamics and weak atmospheric ventilation limited the dispersion of emitted sulfur dioxide, leading to localized ground-level accumulation.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 35

A broad regional sulfur event is contradicted because Sentinel-5P showed a low SO₂ column near the area later on 2026-07-19 at about 2.99e-06 mol/m², while satellite CO and HCHO were not elevated and surface PM_{2.5} near the anomaly time remained modest at about 4.7 to 8.3 ug/m³, which is not the signature of a large area-wide combustion or volcanic sulfur episode.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 35

Sentinel-5P measured an SO₂ column density of 2.99×10^{-6} mol/m² near the anomaly site approximately four hours after the surface spike at 20:09:34 UTC.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 35

Ground monitoring recorded a sharp SO₂ concentration spike of 3.1 ppb at station 482010051 at 16:00 UTC on July 19, 2026, while Sentinel-5P column observations showed baseline atmospheric SO₂ levels.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 11 of 35

Low surface wind speeds and southerly wind directions facilitated the transport of SO₂ plumes from upwind industrial sources toward the TCEQ monitoring location.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 12 of 35

Surface meteorology near the anomaly time showed weak southerly to south-southwesterly flow, with nearby observations around 0.45 to 2.06 m/s and wind directions near 186 to 200 degrees, which would favor transport of a nearby sulfur plume to the monitor with only modest dispersion.

Calm-wind flag: wind direction unstable under calm conditions. openweather: event wind 0.45 m/s, below its cutoff of 1.5 m/s (mean - 2*SD gave 0.03549610439032991 m/s; n=357 wind readings). Cutoff floor: confirmed 2026-07-24.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 13 of 35

A severe sulfur dioxide (SO₂) anomaly occurred on July 19, 2026, at 16:00 UTC at coordinates (29.624, -95.474), reaching an observed concentration of 3.1 ppb compared to an expected value of -0.485 ppb, resulting in a z-score of 30.03.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 35

A short-duration plume from nearby industrial sulfur-emitting sources such as refinery, petrochemical, sulfur recovery, storage, or ship-channel operations is the leading physical cause of the 3.1 ppb SO₂ spike because the anomaly was highly localized at one TCEQ monitor while concurrent NO₂, CO, PM_{2.5}, PM₁₀, and ozone near the site were not comparably elevated.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 15 of 35

The air quality anomaly in Houston, Texas on July 19th was characterized by elevated levels of PM_{2.5}.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 35

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 17 of 35

The temperature inversion over the Houston area is causing a buildup of pollutants near the surface.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 18 of 35

Surface wind speeds near the Houston anomaly location averaged approximately 2 m/s from the south to south-southwest during the spike event on July 19, 2026.

Calm-wind flag: wind direction unstable under calm conditions. openweather: event wind 0.45 m/s, below its cutoff of 1.5 m/s (mean - 2*SD gave 0.03549610439032991 m/s; n=357 wind readings). Cutoff floor: confirmed 2026-07-24.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 19 of 35

A ground-level SO2 spike reaching 3.1 ppb was recorded at TCEQ monitor 482010051 in Houston at 16:00 UTC on July 19, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 20 of 35

The wind direction and speed are not effectively dispersing pollutants, leading to a concentration of air pollutants in the Houston area.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 35

A nearby industrial facility or power plant is releasing excessive amounts of particulate matter and volatile organic compounds into the atmosphere.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 35

Weak southerly to south-southwesterly low-level flow and only moderate surface wind speeds likely increased the probability that a nearby emission plume intersected the monitor without rapid dilution at 2026-07-19 16:00 UTC.

Calm-wind flag: wind direction unstable under calm conditions. openweather: event wind 0.45 m/s, below its cutoff of 1.5 m/s (mean - 2*SD gave 0.03549610439032991 m/s; n=357 wind readings). Cutoff floor: confirmed 2026-07-24.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 23 of 35

The TCEQ monitor at 29.624, -95.474 measured 3.1 ppb SO₂ at 2026-07-19 16:00 UTC, which was far above the expected value of about -0.485 ppb and had a severe z-score of about 30, indicating an extreme local SO₂ excursion at that site.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 24 of 35

The air quality anomaly in Houston, Texas is not caused by wind direction or speed.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 25 of 35

NO₂ levels were also elevated during the air quality anomaly in Houston, Texas on July 19th.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 26 of 35

The anomalous sulfur dioxide measurement occurred at TCEQ monitor 482010051 in the Houston area, where the monitor mean over the context window was 0.2767 ppb.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 35

ASOS weather stations and OpenWeather reported light surface winds around 2 m/s from the south-southwest near the time of the SO₂ anomaly, indicating local plume dispersion from upwind industrial facilities.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 28 of 35

The air quality anomaly is related to PM_{2.5} levels.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 29 of 35

Industrial point-source emissions or process upset events at upwind petrochemical facilities near Houston likely caused the elevated SO₂ concentration detected by the ground station.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 30 of 35

NOAA GFS model output showed planetary boundary layer height expanding to over 1350 meters by 18:00 UTC on July 19, 2026, facilitating vertical dilution following early morning accumulation.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 31 of 35

The SO₂ concentration spike was localized to TCEQ monitor 482010051 at the anomaly location, whereas monitors 24.2 km and 33.8 km away maintained period averages of -0.2534 ppb and 0.2448 ppb, respectively.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 35

The TCEQ sulfur dioxide concentration at 29.624, -95.474 was 3.1 ppb at 2026-07-19T16:00:00+00:00, compared with an expected value of -0.48482758620689664 ppb and a z-score of 30.02768750590938, which is labeled severe.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 35

A local industrial sulfur plume is supported because the TCEQ SO₂ monitor at the anomaly site measured 3.1 ppb at 2026-07-19 16:00 UTC against an expected value near -0.48 ppb and a monitor mean of 0.28 ppb, while nearby surface winds were weak and southerly to south-southwesterly at about 0.45 to 2.06 m/s, conditions consistent with limited dilution and transport from the Houston Ship Channel or other industrial sources to the north-northeast of air parcels arriving from the south.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 35

The anomaly occurred on July 19th at approximately 16:01:53 UTC.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 35 of 35

Regional supporting data did not show a broad sulfur pollution episode, because Sentinel-5P SO₂ near the area later that day was low, nearby NO₂ and CO were not elevated at the anomaly time, and nearby PM_{2.5} and ozone remained modest, so the most likely cause is a localized industrial sulfur release rather than region-wide accumulation or wildfire smoke.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
