

AERIS Expert Review Packet

Anomaly

Source / metric	tceq / so2
Observed / expected	7.2 / 0.217241
Time	2026-08-03 15:00 UTC
Location	29.6697, -95.1285
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	7 / 706	20.95 to 100; mean 68.7606	70.53 at 2026-08-03 14:55Z; dt 5 min
asos	temperature	degC	7 / 706	23.8889 to 37; mean 30.228	31 at 2026-08-03 14:55Z; dt 5 min
asos	wind_direction	degree	7 / 882	0 to 360; mean 154.603	260 at 2026-08-03 14:55Z; dt 5 min
asos	wind_speed	m/s	7 / 919	0 to 33.4389; mean 2.8728	3.08666 at 2026-08-03 14:55Z; dt 5 min
noaa_gfs	gh_500	m	8 / 96	5875.21 to 5918.17; mean 5896.28	5880.42 at 2026-08-03 12:00Z; dt 180 min
noaa_gfs	pbl_height	m	8 / 96	11.2803 to 2539.72; mean 842.081	164.72 at 2026-08-03 12:00Z; dt 180 min
noaa_gfs	precipitable_water	mm	8 / 96	27.1461 to 58.478; mean 37.8292	32.8749 at 2026-08-03 12:00Z; dt 180 min
noaa_gfs	surface_pressure	hPa	8 / 96	1005.04 to 1013.6; mean 1009.42	1009.77 at 2026-08-03 12:00Z; dt 180 min
noaa_gfs	t_850	degC	8 / 96	18.2063 to 21.4418; mean 19.5371	18.5016 at 2026-08-03 12:00Z; dt 180 min
noaa_gfs	u_10m	m/s	8 / 96	-3.62395 to 3.87893; mean 0.0183	0.82968 at 2026-08-03 12:00Z; dt 180 min
noaa_gfs	v_10m	m/s	8 / 96	-3.17918 to 5.58564; mean 1.4632	1.02434 at 2026-08-03 12:00Z; dt 180 min
openaq	ozone	ppm	17 / 1119	-0.004 to 0.081; mean 0.0281	0.017 at 2026-08-03 15:00Z; dt 0 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 36

A short-duration plume from nearby industrial sulfur sources is the most likely physical cause of the 7.2 ppb sulfur dioxide spike at the Houston monitor because sulfur dioxide rose sharply at one TCEQ site while nearby sulfur dioxide monitors did not show a comparable regional increase, which is consistent with a localized source impact rather than a citywide event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 36

Combustion-related industrial operations such as refinery process upset, sulfur recovery activity, or stack emissions are more plausible than wildfire or broad urban traffic as the sulfur dioxide source type because carbon monoxide, ozone, and particulate matter were not simultaneously extreme near the monitor while satellite sulfur dioxide later that day showed only a modest column enhancement compatible with a small or transient local plume.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 36

A severe thunderstorm or tornado event in the Houston area has stirred up dust and debris, contributing to the air quality anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 36

At the exact time and location of the sulfur dioxide anomaly on 2026-08-03T15:00:00+00:00, TCEQ measured concurrent nitrogen dioxide levels of 7.2 ppb, while OpenAQ reported PM10 levels of 40.0 ug/m3 and PM2.5 levels of 14.1 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 36

Sentinel-5P satellite observations detected an increased mean SO2 column density of 0.0001056 mol/m² over the Houston area on August 3, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 36

A short-lived local sulfur emission plume affecting the TCEQ monitor is strongly supported because SO2 reached 7.2 ppb at 2026-08-03T15:00Z at the anomaly monitor while the same monitor's expected value was about 0.22 ppb, the 6-hour TCEQ SO2 mean for 08-03 12Z rose to 0.744 ppb, and the other two nearby TCEQ SO2 monitors had much lower window means of -0.342 ppb and -0.167 ppb, which is consistent with a localized rather than region-wide event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 36

The anomaly is due to a combination of factors including high temperatures, humidity, and stagnant atmospheric conditions, which have led to the formation of ground-level ozone and other pollutants.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 36

The PM2.5 levels are elevated, with a mean of 13.1328 ug/m3 and a maximum value of 557.7 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 36

TCEQ ground-level monitoring detected a sharp SO2 concentration spike of 7.2 ppb at station 482011039 at 15:00 UTC on August 3, 2026, while surrounding TCEQ stations recorded near-zero baseline levels, indicating a highly localized point-source emission event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 36

Meteorological trapping of a nearby plume is supported because the Houston area had light surface winds near the anomaly time of about 1.26 to 3.09 m/s, morning humidity near 70 to 76 percent, clear skies, and a very shallow modeled planetary boundary layer of roughly 95 to 165 m around 12Z, all of which would limit dilution and allow a local SO₂ release to produce a sharp concentration spike.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 11 of 36

The TCEQ ground monitor 482011039 recorded a peak SO₂ concentration of 7.2 ppb at 15:00 UTC on August 3, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 12 of 36

A shallow planetary boundary layer height below 200 meters and light surface winds recorded by GFS and ASOS limited atmospheric mixing and enhanced ground-level SO₂ concentrations.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 13 of 36

The TCEQ monitor at the anomaly location measured a severe and isolated SO₂ spike of 7.2 ppb at 2026-08-03T15:00:00+00:00 against an expected value near 0.22 ppb.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 36

Sentinel-5P satellite measurements captured elevated total column SO₂ levels over the region on August 3, 2026, providing spaceborne evidence of an atmospheric SO₂ plume.

Calm-wind flag: wind direction unstable under calm conditions. noaa_gfs: event wind 1.3181970162090593 m/s, below its cutoff of 1.5 m/s (mean - 2*SD gave 0.44980526654126063 m/s; n=96 wind readings); openweather: event wind 1.26 m/s, below its cutoff of 1.5 m/s (mean - 2*SD gave -0.45239491837320456 m/s; n=360 wind readings). Cutoff floor: confirmed 2026-07-24.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 15 of 36

The air quality anomaly in Houston, Texas is caused by high levels of PM_{2.5} particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 36

During the 18Z time block on 2026-08-03, Sentinel-5P observed an elevated mean SO₂ column density of 0.0001056 mol/m² over the region, compared to negative average column values on August 2 and August 4, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 17 of 36

Localized industrial point-source emissions from regional petrochemical and refining facilities were the primary source of the elevated SO₂ concentration detected by TCEQ monitoring instruments.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 18 of 36

A short-lived nearby industrial sulfur emission plume is more likely than a broad regional combustion or photochemical event because SO₂ spiked strongly while CO, NO₂, ozone, and PM did not show a comparably extreme co-pollutant enhancement near the monitor.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 19 of 36

A severe sulfur dioxide spike of 7.2 ppb was recorded by a TCEQ monitor located at coordinates (29.670, -95.129) on 2026-08-03T15:00:00+00:00, representing a z-score of 19.28 relative to the expected baseline of 0.22 ppb.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 20 of 36

The anomalous pollutant was sulfur dioxide measured by tceq at 29.670, -95.129 in Houston, Texas at 2026-08-03T15:00:00+00:00.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 36

Houston-area meteorology during the anomaly favored poor dispersion of a nearby plume because local winds were light and the morning boundary layer was shallow.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 36

NOAA GFS model simulations showed a suppressed planetary boundary layer height below 100 meters prior to 12:00 UTC on August 3, while ASOS surface stations recorded low wind speeds averaging 2.28 m/s, creating stagnant early morning conditions that trapped point-source SO₂ near the surface.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 23 of 36

Meteorological conditions likely enhanced the sulfur dioxide peak by limiting dilution and allowing narrow plume impacts because low boundary-layer height and light surface winds were present near the event time, with GFS boundary-layer height near 165 m at 12Z and local winds around 1.3 to 3.1 m/s around 15Z.

Calm-wind flag: wind direction unstable under calm conditions. noaa_gfs: event wind 1.3181970162090593 m/s, below its cutoff of 1.5 m/s (mean - 2*SD gave 0.44980526654126063 m/s; n=96 wind readings); openweather: event wind 1.26 m/s, below its cutoff of 1.5 m/s (mean - 2*SD gave -0.45239491837320456 m/s; n=360 wind readings). Cutoff floor: confirmed 2026-07-24.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 24 of 36

The CO, SO₂, and O₃ levels were also elevated during the anomaly period, indicating potential contributions from industrial sources and vehicle emissions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 25 of 36

The air quality anomaly in Houston, Texas is caused by high levels of SO2 particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 26 of 36

The air quality anomaly is caused by a nearby industrial facility releasing excessive amounts of particulate matter and volatile organic compounds.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 36

The tceq sulfur dioxide measurement at 2026-08-03T15:00:00+00:00 was 7.2 ppb, compared with an expected value of 0.21724137931034482 ppb, corresponding to a z-score of 19.276449828645912 and severe anomaly classification.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 28 of 36

A broad combustion or regional photochemical episode is not strongly supported because co-located TCEQ CO was only 0.2 ppm, co-located TCEQ NO₂ was 7.2 ppb without an exceptional multi-site enhancement, nearby OpenAQ ozone was only 0.017 ppm at the anomaly time, and Sentinel-5P later showed only modest SO₂ column enhancement with no corresponding strong CO enhancement, which argues against a large regional smoke or widespread industrial combustion event even though a larger industrial source cannot be excluded.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 29 of 36

The temperature and wind speed data suggest that the air quality anomaly was exacerbated by a heatwave and stagnant atmospheric conditions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 30 of 36

The air quality anomaly is related to PM_{2.5} levels.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 31 of 36

Sentinel-5P satellite observations recorded an elevated mean SO₂ column density of 0.000106 mol/m² over the Houston area during the August 3 18:00 UTC granule pass, confirming enhanced atmospheric SO₂ mass relative to negative baseline averages on August 2 and August 4.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 36

The anomaly occurred on August 2nd and 3rd, with the highest levels recorded at 18Z on August 3rd.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 36

The nearest tceq sulfur dioxide monitor had a mean sulfur dioxide value of 0.379 ppb over the context window, and the 6-hour mean for tceq sulfur dioxide at 2026-08-03 12Z was 0.7444 ppb, both far below the 7.2 ppb anomaly value.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 36

The air quality anomaly in Houston, Texas is likely caused by a combination of factors including high levels of PM2.5 and NO2 emissions from industrial activities and vehicle traffic.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 35 of 36

The air quality anomaly in Houston, Texas is caused by high levels of NO2 particles.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 36 of 36

A shallow morning boundary layer identified by NOAA GFS combined with light surface winds recorded by ASOS stations hindered vertical atmospheric mixing and trapped SO2 near the surface.

Mark exactly one:☐ V☐ I☐ U**Note:**

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
