

AERIS Expert Review Packet

Anomaly

Source / metric	tceq / no2
Observed / expected	44.3 / 6.78264
Time	2026-07-22 02:00 UTC
Location	29.8027, -95.1255
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	7 / 724	29.01 to 100; mean 65.7339	55.64 at 2026-07-22 01:55Z; dt 5 min
asos	temperature	degC	7 / 724	23.2222 to 39; mean 30.9161	32 at 2026-07-22 01:55Z; dt 5 min
asos	wind_direction	degree	7 / 886	0 to 360; mean 193.33	210 at 2026-07-22 01:55Z; dt 5 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 35

The PM2.5 levels exceeded the normal range, with a peak value of 14.85 ug/m3 at sensor 186271.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 35

The air quality anomaly in Houston, Texas on July 22nd was caused by a combination of factors including high temperatures, low wind speeds, and nearby industrial activities.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 35

The 6-hour mean across tceq NO2 monitors for 2026-07-22 00Z was 10.57 ppb, which is much lower than the 44.3 ppb reading at the anomaly monitor at 2026-07-22T02:00:00+00:00.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 35

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 35

Local dispersion near the anomaly was only modest because nearby surface winds were light at about 1.8 to 2.1 m/s, while the modeled planetary boundary layer height near 00Z was about 1536 m rather than strongly collapsed.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 35

Meteorological support for accumulation is moderate rather than strong because surface winds near the anomaly were light at about 1.8 to 2.1 m/s with very low cloud cover and no precipitation, but the gfs planetary boundary layer height nearest in time was still about 1536 m at 00Z, which does not indicate an already well-established very shallow nocturnal boundary layer at the exact event time.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 35

Regional average NO2 levels across TCEQ monitoring stations peaked during the 6-hour window centered on 2026-07-22T00:00:00+00:00 at 10.57 ppb before returning to baseline levels around 6.37 ppb in the subsequent period.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 35

The anomaly occurred on July 22nd, around 01:59:46 UTC, at a location approximately 14.959 km from the query point.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 35

A surface NO2 concentration peak of 44.3 ppb was recorded by a TCEQ monitoring station in Houston at 02:00 UTC on July 22, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 35

A broad regional photochemical or wildfire episode is contradicted because ozone near the anomaly was only 0.042 ppm at 02:00 UTC, particulate matter was only modestly elevated near the anomaly, and the nearest prior-day satellite column fields did not show unusually high NO₂ or CO over the area before the spike.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 11 of 35

A broad transported smoke or regional combustion episode is a less plausible primary cause of the NO₂ spike because satellite CO and NO₂ columns before the event were not unusually high, surface PM_{2.5} and PM₁₀ were only moderate around the event time, and no precipitation or cloud-driven convective disturbance was present to suggest a large-scale plume passage.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 12 of 35

Regional wildfire or broad-area secondary pollution is unlikely because concurrent CO and SO₂ near the area remained low, PM_{2.5} was only moderate, ozone was not unusually high for Houston, and Sentinel-5P did not show an elevated regional NO₂ column at the next overpass.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 13 of 35

The TCEQ NO2 monitor at 29.803, -95.126 recorded 44.3 ppb at 2026-07-22T02:00:00+00:00, which is an extreme local spike relative to the expected 6.78 ppb background and the 07-22 00Z 6-hour multi-monitor mean of 10.57 ppb.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 35

The air quality anomaly is related to PM2.5 levels.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 15 of 35

Atmospheric trapping was facilitated by light surface winds recorded around 2.05 m/s by ASOS weather stations along with low night-time planetary boundary layer heights modeled by GFS during the anomaly period.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 35

The air quality anomaly in Houston, Texas is not caused by wind direction or speed.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 17 of 35

The air quality anomaly in Houston, Texas is not caused by changes in temperature.

Mark exactly one:

☐ V

☐ I

☐ U

Note:

Claim 18 of 35

A nearby industrial facility or power plant is releasing excessive amounts of particulate matter and volatile organic compounds into the atmosphere.

Mark exactly one:

☐ V

☐ I

☐ U

Note:

Claim 19 of 35

Mobile source emissions from evening traffic contributed to the localized spike in NO₂ concentration detected at the TCEQ monitoring site.

Mark exactly one:

☐ V

☐ I

☐ U

Note:

Claim 20 of 35

Weak near-surface ventilation and nighttime retention likely amplified the NO₂ concentration at the monitor because local winds were light at about 1.8 to 2.1 m/s near the event and nocturnal boundary layers in the period commonly collapsed to roughly 100 to 200 m later in the night, conditions that favor short-lived accumulation of primary NO_x near sources.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 35

A combination of high-pressure weather systems and stagnant air patterns is trapping pollutants in the Houston area, leading to poor air quality.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 35

TCEQ ground monitoring recorded a severe nitrogen dioxide spike reaching 44.3 ppb at 02:00 UTC on July 22, 2026, contrasting with the regional network baseline mean of approximately 6.23 ppb.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 23 of 35

A severe NO₂ concentration spike reaching 44.3 ppb was observed at coordinates (29.803, -95.126) on 2026-07-22T02:00:00+00:00, compared to an expected mean value of 6.78 ppb and a z-score of 8.90.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 24 of 35

The temperature inversion over the Houston area is causing a buildup of pollutants near the surface.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 25 of 35

Local industrial combustion sources in the Houston region released nitrogen oxides that accumulated near the TCEQ monitoring station under weak surface winds.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 26 of 35

Sentinel-5P satellite observations recorded stable total tropospheric NO₂ column densities between July 21 and July 22, 2026, indicating that the NO₂ enhancement was confined to the immediate surface boundary layer rather than a broad regional atmospheric plume.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 35

The tceq NO2 anomaly at 29.803, -95.126 had an expected value of 6.782638888888889 ppb, a z-score of 8.899715622862008, and a severity classification of severe.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 28 of 35

The tceq NO2 monitor at 29.803, -95.126 recorded 44.3 ppb at 2026-07-22T02:00:00+00:00.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 29 of 35

The PM2.5 levels are elevated, with a mean of 10.7511 ug/m3 and a maximum value of 149.3 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 30 of 35

ASOS weather stations recorded light surface winds near 2.0 m/s during the time of the NO2 anomaly, limiting horizontal dispersion of local emissions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 31 of 35

A decaying planetary boundary layer height combined with low wind speeds during the evening transition trapped surface emissions and restricted atmospheric dispersion.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 35

A fresh, highly localized NO_x emission plume from nearby combustion sources such as ship-channel industry, port activity, diesel traffic, rail, or nonroad equipment is a leading physical cause of the 44.3 ppb NO₂ spike because the anomaly was extreme at one tceq monitor while regional co-pollutants were only modest and area-wide ozone was not elevated enough to indicate a broad regional event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 35

A localized fresh-combustion plume is strongly supported because the tceq NO₂ concentration at monitor 482010026 reached 44.3 ppb at 2026-07-22T02:00:00+00:00 while the 6-hour multi-monitor mean was only 10.57 ppb and nearby co was only 0.2 ppm with so₂ at 0.4 ppb, a pattern consistent with a short-lived local traffic or combustion source rather than a region-wide sulfur-rich plume.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 35

The GFS model indicated a collapse of the planetary boundary layer height during the late evening hours on July 21 to July 22, 2026, restricting vertical atmospheric mixing.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 35 of 35

NO₂ levels were also elevated, with a peak value of 44.3 ppb at monitor 482010026.

Mark exactly one:☐ V☐ I☐ U**Note:**

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
