

AERIS Expert Review Packet

Anomaly

Source / metric	tceq / no2
Observed / expected	17.9 / 2.08494
Time	2026-06-16 02:00 UTC
Location	29.6957, -95.4992
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	9 / 617	57.73 to 100; mean 89.408	94.24 at 2026-06-16 01:55Z; dt 5 min
asos	temperature	degC	9 / 617	22.7778 to 33.3333; mean 26.6362	26 at 2026-06-16 01:55Z; dt 5 min
asos	wind_direction	degree	9 / 617	0 to 360; mean 119.514	100 at 2026-06-16 01:55Z; dt 5 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 35

The PM2.5 levels in the affected area exceeded the normal range, indicating a significant increase in particulate matter in the air.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 35

Regional TCEQ monitors recorded elevated network-wide 6-hour mean NO2 levels peaking at 10.67 ppb leading into the 00:00 UTC period on June 16, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 35

TCEQ surface observations and GFS atmospheric model data indicate that a drop in planetary boundary layer height to below 160 meters near 02:00 UTC restricted vertical mixing, causing localized concentration of surface NO2 emissions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 35

The air quality anomaly is related to PM2.5 levels.

Mark exactly one:

☐ V

☐ I

☐ U

Note:

Claim 5 of 35

The tceq NO2 monitor at 29.696, -95.499 recorded 17.9 ppb at 2026-06-16T02:00:00+00:00, compared with an expected value of 2.084939759036145 ppb, corresponding to a z-score of 8.059392672370368 and severe anomaly classification.

Mark exactly one:

☐ V

☐ I

☐ U

Note:

Claim 6 of 35

The PM2.5 levels are elevated at 15.2 ug/m3, which is higher than the mean of 8.0664 ug/m3.

Mark exactly one:

☐ V

☐ I

☐ U

Note:

Claim 7 of 35

Ozone titration by freshly emitted NO is a likely physical cause of the observed chemical signature because ozone near the anomaly dropped to 0.009 ppm and the broader 6-hour ozone mean declined further after 00 UTC while the TCEQ network 6-hour NO₂ mean rose to 10.67 ppb, indicating nighttime conversion within a fresh urban plume rather than regionally mixed daytime production.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 35

The TCEQ Houston monitor recorded a severe NO₂ spike to 17.9 ppb at 2026-06-16T02:00:00+00:00 while the 6-hour network mean had already risen to 10.67 ppb for 06-16 00Z, indicating elevated local nighttime NO_x conditions around the anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 35

A shallow nocturnal planetary boundary layer and light surface winds suppressed atmospheric mixing, trapping surface nitrogen dioxide concentrations near the ground.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 35

Air-chemistry context favored a fresh local combustion plume because ozone at the anomaly time was only 0.009 ppm while PM2.5 remained modest near 9.1 to 15.2 ug/m3 and SO2 was only 0.4 ppb, which is inconsistent with a broad regional photochemical or smoke episode.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 11 of 35

A severe nocturnal nitrogen dioxide concentration spike of 17.9 ppb was detected at 02:00 UTC on June 16, 2026, at the TCEQ monitoring station in Houston.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 12 of 35

Concurrently elevated PM2.5 concentrations observed across PurpleAir and OpenAQ sensor networks support local primary combustion emissions, such as vehicular traffic or nearby industrial activity, as the main driver of the event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 13 of 35

Accumulation of evening vehicular traffic emissions along nearby urban transport corridors contributed to elevated localized nitrogen dioxide levels under low-wind conditions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 35

Meteorological conditions near the anomaly featured weak winds near 1.1 to 3.1 m/s, very high humidity near 93 to 94 percent, complete cloud cover, and a shallow planetary boundary layer near 105 m, which would strongly suppress dispersion and favor NO₂ accumulation.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 15 of 35

Low ambient ozone levels recorded near the anomaly location indicate nocturnal titration of ozone by local nitric oxide emissions into nitrogen dioxide.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 35

Low nighttime ozone concentrations recorded across OpenAQ and TCEQ monitoring networks at 02:00 UTC confirm suppressed photolysis and rapid titration of ozone by fresh nitric oxide emissions under dark conditions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 17 of 35

Weak dispersion and nighttime trapping are a likely physical cause of the NO₂ enhancement because surface winds near the event were light at about 1.1 to 3.1 m/s, humidity was very high near 93 to 94 percent, and modeled planetary boundary layer height was very low near 105 m around 00 UTC and fell lower afterward, favoring accumulation of locally emitted NO_x.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 18 of 35

The increase in PM_{2.5} levels is due to an industrial accident at a nearby facility.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 19 of 35

At 2026-06-16T02:00:00+00:00, ozone at the nearest openaq sensor was 0.009 ppm, and the 6-hour mean of tceq NO2 for 2026-06-16 00Z was 10.67 ppb across the local monitor set.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 20 of 35

A combination of stagnant weather patterns and increased emissions from vehicles and industrial activities has contributed to the anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 35

The air quality anomaly in Houston, Texas on June 16th was caused by a combination of factors including high temperatures, low wind speeds, and nearby industrial activities.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 35

A severe nitrogen dioxide (NO2) anomaly was recorded by TCEQ at coordinates (29.696, -95.499) on June 16, 2026, at 02:00 UTC, reaching a concentration of 17.9 ppb compared to an expected value of 2.08 ppb.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 23 of 35

A broad regional combustion or secondary aerosol episode is not strongly supported because PM2.5 was only modestly elevated near the site, PM10 was not extreme, SO2 remained near background, and the available satellite context does not show corroborating elevated trace-gas columns close in time to the event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 24 of 35

Planetary boundary layer height dropped below 150 meters alongside low surface wind speeds under 1.6 m/s, suppressing atmospheric dispersion in Houston.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 25 of 35

The anomaly occurred at 2026-06-16T02:00:00+00:00 in Houston, Texas at the tceq NO2 monitor 482010055 located at 29.696, -95.499.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 26 of 35

A nearby fresh combustion NO_x plume is a likely physical cause of the 17.9 ppb NO₂ spike because the anomalous monitor reading occurred with concurrent low ozone of 0.009 ppm and moderately elevated CO of 0.5 ppm, which is a pattern consistent with recent local traffic, industrial, marine, rail, or other combustion emissions affecting the site.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 35

The anomaly occurred on June 16th at approximately 02:00:00+00:00, with the nearest sensor located 2.576 km away.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 28 of 35

Nighttime accumulation under weak dispersion is supported because the anomaly occurred with very high humidity near 94 percent, low local wind speeds near 1.1 to 3.1 m/s, nearly complete cloud cover, and a modeled planetary boundary layer height near 105 m around 00 UTC that fell further to very low 6-hour mean values by 06 UTC, all of which favor trapping of primary pollutants near the surface.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 29 of 35

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5 particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 30 of 35

The air quality anomaly in Houston, Texas is caused by high levels of NO2 concentrations.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 31 of 35

The CO levels were also elevated, suggesting a potential contribution from nearby industrial activities or vehicle emissions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 35

The air quality anomaly in Houston, Texas is caused by high levels of CO concentrations.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 35

A local fresh NO_x emission plume is supported because the anomalous NO₂ concentration of 17.9 ppb at 02:00 UTC coincided with suppressed ozone of 0.009 ppm at the same location and time, which is a classic near-source titration signature of recent NO emissions rather than aged regional pollution.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 35

The anomaly is caused by a high-pressure system that has been lingering over the region.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 35 of 35

Industrial combustion emissions from regional point sources accumulated locally due to weak boundary layer ventilation and stagnant winds.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
