

AERIS Expert Review Packet

Anomaly

Source / metric	tceq / no2
Observed / expected	28.8 / 4.73172
Time	2026-07-08 00:00 UTC
Location	29.8342, -95.4891
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	9 / 839	39.12 to 100; mean 73.707	55.64 at 2026-07-07 23:55Z; dt 5 min
asos	temperature	degC	9 / 839	21.6667 to 36.1111; mean 28.8204	32 at 2026-07-07 23:55Z; dt 5 min
asos	wind_direction	degree	9 / 1094	0 to 360; mean 134.232	0 at 2026-07-07 23:55Z; dt 5 min
asos	wind_speed	m/s	9 / 1126	0 to 15.4333; mean 2.2433	0 at 2026-07-07 23:55Z; dt 5 min
noaa_gfs	gh_500	m	10 / 130	5891.13 to 5924.31; mean 5909.1	5911.33 at 2026-07-08 00:00Z; dt 0 min
noaa_gfs	pbl_height	m	10 / 130	19.6394 to 2239.24; mean 721.26	1282.97 at 2026-07-08 00:00Z; dt 0 min
noaa_gfs	precipitable_water	mm	10 / 130	37.6598 to 52.9161; mean 45.7319	49.6827 at 2026-07-08 00:00Z; dt 0 min
noaa_gfs	surface_pressure	hPa	10 / 130	1006.52 to 1017.31; mean 1013.23	1012.12 at 2026-07-08 00:00Z; dt 0 min
noaa_gfs	t_850	degC	10 / 130	17.4065 to 20.4926; mean 19.0969	18.4321 at 2026-07-08 00:00Z; dt 0 min
noaa_gfs	u_10m	m/s	10 / 130	-2.83889 to 1.82714; mean 0.3481	-0.758887 at 2026-07-08 00:00Z; dt 0 min
noaa_gfs	v_10m	m/s	10 / 130	-0.854414 to 4.9494; mean 2.1456	3.8694 at 2026-07-08 00:00Z; dt 0 min
openaq	ozone	ppm	17 / 785	-0.004 to 0.069; mean 0.0172	0.015 at 2026-07-08 00:00Z; dt 0 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 36

The anomaly is caused by a nearby industrial facility releasing excessive amounts of particulate matter into the atmosphere.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 36

Surface wind observations from ASOS stations recorded calm conditions reaching 0.0 m/s near the anomaly location around 2026-07-08T00:00:00Z, facilitating localized pollutant accumulation through atmospheric stagnation.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 36

Regional smoke transport or a broad sulfur-rich industrial episode is not strongly supported because Sentinel-5P CO and NO₂ columns near Houston were not unusually elevated before the event, Sentinel-5P SO₂ was near zero on 2026-07-07 18Z, TCEQ SO₂ near the event was -0.4 ppb, and area PM_{2.5} remained modest at 4.586 ug/m³ in the 00Z six-hour mean.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 36

The TCEQ monitoring network recorded a severe NO2 concentration anomaly reaching 28.8 ppb at 2026-07-08T00:00:00Z in Houston, Texas.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 36

The air quality anomaly in Houston, Texas on July 8th was characterized by elevated levels of PM2.5.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 36

ASOS meteorological stations near the anomaly site observed calm surface winds with speeds dropping to 0.0 m/s around 2026-07-07T23:55:00Z.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 36

The anomalous TCEQ NO2 value of 28.8 ppb exceeds the expected value of 4.731724137931035 ppb by about 24.1 ppb and has a reported z-score of 6.803119928227577 with severe severity.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 36

The air quality anomaly in Houston, Texas is not caused by high levels of NO₂.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 36

The Houston NO₂ anomaly is consistent with enhanced nighttime accumulation because the nearest ASOS station reported calm winds at 23:55Z, the 06Z six-hour ASOS wind-speed mean was only 0.3517 m/s across the area, and GFS planetary boundary layer height dropped from about 1283 m at 00Z to about 251 m by 06Z, indicating increasingly poor dispersion overnight.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 36

Weak near-surface dispersion is a likely contributing cause because the nearest ASOS station reported calm wind at 23:55Z, the 06Z ASOS 6-hour mean wind speed dropped to 0.35 m/s, and very light winds favor local NO₂ buildup near sources in the Houston urban boundary layer.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 11 of 36

A short-duration plume from nearby combustion sources such as roadway traffic, industrial combustion, or diesel equipment is a likely physical cause because the anomalous TCEQ monitor measured 28.8 ppb NO₂ at 00Z while nearby area-wide TCEQ NO₂ conditions were much lower on average and the closest TCEQ CO monitor showed contemporaneous combustion-related CO present at 0.6 ppm.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 12 of 36

A severe thunderstorm or tornado event in the region has stirred up dust and pollutants, contributing to the air quality anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 13 of 36

TCEQ ground monitors detected a sharp increase in surface NO₂ to 28.8 ppb at the anomaly site, aligned with an increase in total NO₂ column density observed by Sentinel-5P over the larger Houston domain.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 36

The pollutant anomaly is a TCEQ NO2 measurement of 28.8 ppb at 2026-07-08T00:00:00+00:00 at coordinates 29.834, -95.489 in Houston.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 15 of 36

The air quality anomaly is related to PM2.5.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 16 of 36

The Houston NO2 anomaly is consistent with a short-lived nearby combustion plume because the anomalous TCEQ monitor measured 28.8 ppb NO2 at 00Z while the nearest colocated ozone observation was only 0.015 ppm and nearby TCEQ CO reached 0.6 ppm, which is a fresh-emission pattern with titration of ozone by recently emitted NO.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 17 of 36

Accumulated local evening rush-hour vehicular emissions under calm atmospheric conditions directly contributed to the sharp spike in NO₂ concentrations observed by TCEQ.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 18 of 36

The TCEQ monitor at 29.834, -95.489 recorded 28.8 ppb NO₂ at 2026-07-08T00:00:00Z, which was far above the monitor-specific expected value of 4.73 ppb and above the contemporaneous 6-hour area mean of 6.90 ppb, indicating a strongly localized NO₂ enhancement.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 19 of 36

A severe nitrogen dioxide (NO₂) concentration anomaly of 28.8 ppb was detected at coordinates (29.834, -95.489) on 2026-07-08T00:00:00+00:00, significantly exceeding the expected baseline value of 4.73 ppb.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 20 of 36

NOAA GFS model data shows planetary boundary layer height collapsing from nearly 2000 meters at 18:00 UTC on July 7 to 976 meters by 00:00 UTC on July 8, 2026, trapping ground-level nitrogen dioxide emissions within a shrinking boundary layer.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 36

The anomaly occurred on July 8th, 2026, around 00:01:52 UTC, and was located approximately 15.756 km from the query point.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 36

The PM2.5 levels are elevated at 18.7 ug/m3, which is higher than the mean of 7.33 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 23 of 36

The anomaly was likely caused by a combination of factors, including local emissions and weather patterns.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 24 of 36

Sentinel-5P recorded an elevated tropospheric NO₂ column density averaging 4.31e-5 mol/m² over the area during the 18Z window on July 8, 2026.

Mark exactly one:

☐ V

☐ I

☐ U

Note:

Claim 25 of 36

The air quality anomaly in Houston, Texas is not caused by high levels of SO₂.

Mark exactly one:

☐ V

☐ I

☐ U

Note:

Claim 26 of 36

Fresh local NO_x emissions with limited immediate oxidation are a likely cause because ozone near the anomaly was only 0.015 ppm at 00Z, TCEQ SO₂ near the time was not elevated, PM_{2.5} remained modest across OpenAQ and PurpleAir, and Sentinel-5P did not indicate a coincident regional combustion or sulfur event over Houston.

Mark exactly one:

☐ V

☐ I

☐ U

Note:

Claim 27 of 36

The 6-hour mean across 12 TCEQ NO₂ monitors for 2026-07-08 00Z is 6.903 ppb, which is far below the anomalous monitor reading of 28.8 ppb at the same time.

Mark exactly one:

☐ V

☐ I

☐ U

Note:

Claim 28 of 36

NO2 levels were also significantly higher than normal during the same period.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 29 of 36

NOAA GFS model output showed the planetary boundary layer height rapidly dropping from nearly 2000 meters at 18:00 UTC down to approximately 976 meters at 00:00 UTC on July 8.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 30 of 36

Near-zero surface wind speeds measured by ASOS stations hindered horizontal ventilation, preventing the dispersion of emitted nitrogen dioxide near the TCEQ station.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 31 of 36

OpenAQ ozone near the anomaly location was 0.015 ppm at 2026-07-08T00:00:00Z, which is consistent with a fresh NOx plume that had not produced elevated ozone and may have locally suppressed ozone through titration.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 36

The anomaly is a result of a combination of factors including high temperatures, low humidity, and stagnant atmospheric conditions, which have led to the accumulation of pollutants in the area.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 33 of 36

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 34 of 36

The collapse of the planetary boundary layer height depicted in GFS reanalysis constrained vertical mixing, trapping urban NOx emissions close to the surface.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 35 of 36

Surface wind speed measured near the anomaly location dropped to 0.0 m/s at 2026-07-07T23:55:00+00:00.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 36 of 36

ASOS observations nearest the anomaly showed 0.0 m/s wind at 2026-07-07T23:55:00Z and the 06Z period had a 6-hour mean wind speed of only 0.35 m/s, supporting weak dispersion that would trap a nearby combustion plume near the surface.

Calm-wind flag: wind direction unstable under calm conditions. openweather: event wind 0.89 m/s, below its cutoff of 1.5 m/s (mean - 2*SD gave -0.38737025451646634 m/s; n=360 wind readings). Cutoff floor: confirmed 2026-07-24.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
