

AERIS Expert Review Packet

Anomaly

Source / metric	openaq / pm25
Observed / expected	42 / 12.8663
Time	2026-06-18 13:00 UTC
Location	29.7690, -95.3179
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	9 / 637	54.54 to 100; mean 82.9069	94.33 at 2026-06-18 12:55Z; dt 5 min
asos	temperature	degC	9 / 637	23 to 35; mean 28.4875	28 at 2026-06-18 12:55Z; dt 5 min
asos	wind_direction	degree	9 / 638	0 to 360; mean 134.53	190 at 2026-06-18 12:55Z; dt 5 min
asos	wind_speed	m/s	9 / 639	0 to 13.3755; mean 4.1083	2.57222 at 2026-06-18 12:55Z; dt 5 min
noaa_gfs	gh_500	m	11 / 132	5850.83 to 5918.16; mean 5882.92	5868.11 at 2026-06-18 12:00Z; dt 60 min
noaa_gfs	pbl_height	m	11 / 132	17.322 to 1845; mean 630.985	417.381 at 2026-06-18 12:00Z; dt 60 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 36

NO₂ levels were also elevated during the same period.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 36

A severe thunderstorm or tornado event occurred in the area, stirring up pollutants and reducing air quality.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 36

High relative humidity levels exceeding 75% during the morning hours facilitated hygroscopic growth of fine particulate matter, increasing total measured PM_{2.5} mass concentrations.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 36

A coarse-particle or mixed aerosol event was a plausible contributor because PM₁₀ rose strongly at the same time as PM_{2.5}, while low ozone and the absence of strong satellite SO₂ enhancement do not support a purely photochemical sulfate episode.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 36

Coincident elevations in PM₁₀ and carbon monoxide concentrations between 12:00 UTC and 18:00 UTC on June 18 indicate a primary urban emission contribution to the PM_{2.5} spike.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 36

A major regional combustion or sulfur-rich industrial plume is not strongly supported because the anomaly coincided with low ozone near 0.013 ppm, only moderate co-pollutant levels of about 0.2 ppm CO and 11.1 ppb NO₂, and no clear satellite sulfur enhancement, even though elevated PM₁₀ to 68 ug/m³ indicates some possible coarse-particle contribution.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 36

Regional or local transport from the Gulf and the Houston Ship Channel industrial corridor was a plausible contributor because winds near the anomaly were southerly to south-southwesterly, which can advect marine aerosol and industrial particulate matter toward central Houston.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 36

A shallow morning planetary boundary layer on June 18, 2026, restricted vertical dispersion and trapped particulate pollution near the ground level.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 36

A shallow planetary boundary layer and light surface winds limited vertical atmospheric mixing, trapping locally emitted fine particulate matter near the ground.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 36

High morning relative humidity levels above eighty percent enhanced hygroscopic growth of atmospheric aerosols, increasing total measured PM2.5 mass concentration.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 11 of 36

Southerly to southeasterly surface wind flow transported and concentrated local urban and industrial particulate emissions into the affected area.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 12 of 36

The anomaly occurred on June 18th, 2026, around 13:00:19+00:00 (0.3 min away) and was detected at a location approximately 2.006 km from the query point.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 13 of 36

Houston PM2.5 was elevated across both openaq and purpleair networks near 2026-06-18 13:00 UTC, indicating a real multi-sensor particulate episode rather than an isolated monitor artifact.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 36

The air quality anomaly in Houston, Texas is caused by high levels of CO particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 15 of 36

Relative humidity levels above 76% in Houston during the morning of June 18, 2026, promoted hygroscopic aerosol growth that intensified PM2.5 concentrations.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 36

The anomaly is a result of a wildfire or agricultural burning in the surrounding areas, releasing large amounts of particulate matter into the atmosphere.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 17 of 36

Houston meteorology likely contributed to PM2.5 accumulation because the anomaly occurred with very high near-surface humidity, light winds, and a relatively shallow morning boundary layer that would reduce dispersion and enhance hygroscopic particle growth.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 18 of 36

The anomaly was likely caused by a combination of factors, including weather patterns and local emissions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 19 of 36

Houston aerosol composition during the episode was most consistent with a mixed urban particle event with some coarse-mode contribution rather than a dominant major combustion or sulfur-rich plume, because PM10 increased while ozone remained modest and satellite CO and SO2 showed no strong enhancement.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 20 of 36

The nearest openaq PM10 measurement at the same location and time was 68.0 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 36

The anomaly is caused by a nearby industrial facility releasing excessive amounts of particulate matter into the atmosphere.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 36

The purpleair PM2.5 measurement nearest in time to 2026-06-18T13:00:00+00:00 and within 2.006 km of (29.769, -95.318) was 39.8 ug/m3.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 23 of 36

The air quality anomaly in Houston, Texas is caused by high levels of NO2 particles.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 24 of 36

On June 18, 2026, at 13:00 UTC, surface air quality monitors in Houston recorded a PM2.5 peak of 42.0 µg/m³ alongside elevated PM10 levels.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 25 of 36

A shallow planetary boundary layer below 310 meters during the morning of June 18, 2026, suppressed vertical atmospheric mixing and trapped local combustion emissions.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 26 of 36

The openaq PM2.5 measurement at 2026-06-18T13:00:00+00:00 at (29.769, -95.318) was 42.0 ug/m3, compared with an expected value of 12.866257668711656 ug/m3, corresponding to a z-score of 6.630573005685529 and a severe anomaly classification.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 36

On June 18, 2026, at 13:00 UTC, OpenAQ recorded a severe PM2.5 anomaly reaching 42.0 ug/m3 in Houston, Texas at location (29.769, -95.318) against an expected baseline of 12.87 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 28 of 36

At 13:00 UTC on June 18, 2026, PurpleAir sensors within 2.1 km of the anomaly site recorded elevated PM2.5 concentrations reaching 39.8 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 29 of 36

The air quality anomaly is related to PM2.5 levels.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 30 of 36

The PM2.5 levels are elevated at 39.8 ug/m3, which is higher than the mean of 15.5881 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 31 of 36

At 13:00 UTC on June 18, 2026, OpenAQ PM10 measurements at the anomaly location peaked at 68.0 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 36

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5 particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 36

A Houston-area accumulation episode is strongly supported because PM2.5 rose sharply and broadly across independent surface networks at the anomaly time, with openaq PM2.5 reaching 42.0 ug/m3 and purpleair PM2.5 reaching 39.8 ug/m3 near the site while 6-hour mean PM2.5 increased to about 30 ug/m3 in both networks on 2026-06-18 12Z.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 36

The air quality anomaly in Houston, Texas on June 18th was characterized by elevated levels of PM2.5.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 35 of 36

Houston meteorology near 2026-06-18 13:00 UTC featured very high humidity, light southerly flow, and only moderate boundary-layer depth, conditions that favor accumulation and hygroscopic enhancement of particulate matter.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 36 of 36

Meteorological conditions support inefficient dispersion and moisture-enhanced particle mass because near the anomaly the air was very humid, winds were light to modest, and modeled boundary-layer depth was still relatively low for daytime, with about 94 percent relative humidity at the nearest ASOS observation, about 2.2 to 2.6 m/s surface wind near the site, and GFS planetary boundary-layer height near 417 m at 12Z.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
