

AERIS Expert Review Packet

Anomaly

Source / metric	tceq / no2
Observed / expected	9.1 / 1.63243
Time	2026-06-03 10:00 UTC
Location	29.5831, -95.0155
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	6 / 421	50.67 to 100; mean 83.4543	91.32 at 2026-06-03 09:55Z; dt 5 min
asos	temperature	degC	6 / 421	22 to 33; mean 26.2482	23.5 at 2026-06-03 09:55Z; dt 5 min
asos	wind_direction	degree	6 / 420	0 to 360; mean 90.7619	20 at 2026-06-03 09:55Z; dt 5 min
asos	wind_speed	m/s	6 / 421	0 to 9.77444; mean 2.9083	5.65888 at 2026-06-03 09:55Z; dt 5 min
noaa_gfs	gh_500	m	6 / 72	5866.59 to 5898.5; mean 5879.83	5868.02 at 2026-06-03 12:00Z; dt 120 min
noaa_gfs	pbl_height	m	6 / 72	14.9006 to 1735.86; mean 447.918	231.159 at 2026-06-03 12:00Z; dt 120 min
noaa_gfs	precipitable_water	mm	6 / 72	46.2607 to 56.7462; mean 51.46	53.9548 at 2026-06-03 12:00Z; dt 120 min
noaa_gfs	surface_pressure	hPa	6 / 72	1009.78 to 1015.86; mean 1013.02	1014.81 at 2026-06-03 12:00Z; dt 120 min
noaa_gfs	t_850	degC	6 / 72	15.9888 to 19.4844; mean 17.4545	16.7966 at 2026-06-03 12:00Z; dt 120 min
noaa_gfs	u_10m	m/s	6 / 72	-4.66046 to 0.147017; mean -2.2013	-2.41627 at 2026-06-03 12:00Z; dt 120 min
noaa_gfs	v_10m	m/s	6 / 72	-3.20242 to 3.40106; mean 0.1268	-1.09242 at 2026-06-03 12:00Z; dt 120 min
openaq	ozone	ppm	11 / 747	-0.002 to 0.094; mean 0.0182	0.016 at 2026-06-03 10:00Z; dt 0 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 36

The anomaly is a result of a combination of factors including high temperatures, low humidity, and stagnant atmospheric conditions, which have led to an accumulation of pollutants in the area.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 36

Boundary-layer suppression likely helped elevate near-surface NO₂ because humidity near the anomaly was very high at about 91 to 93 percent, cloud cover near the anomaly was 76 percent, and GFS planetary boundary layer height was low at about 231 m near 12Z on 2026-06-03, although the evidence is weakened by observed surface wind speeds of about 5.66 m/s at the nearest ASOS station and 2.12 m/s in openweather that indicate ventilation was not extremely stagnant.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 36

A fresh local combustion plume from nearby traffic, diesel activity, or industrial combustion is a plausible cause of the NO₂ anomaly because the NO₂ spike occurred without corresponding increases in ozone, PM_{2.5}, PM₁₀, CO, or SO₂, which is consistent with a spatially narrow and recently emitted NO_x-rich plume near the monitor.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 36

The air quality anomaly in Houston, Texas is caused by high levels of CO particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 36

Co-pollutant and regional-context data show only modest CO, SO₂, PM_{2.5}, PM₁₀, and ozone near the anomaly time, which makes a broad regional episode or a large sulfur-rich combustion event less likely than a localized fresh combustion source.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 36

The tceq NO₂ anomaly occurred at 2026-06-03T10:00:00+00:00 at location (29.583, -95.016).

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 36

The PM_{2.5} levels are elevated at 5.2 ug/m³, which is higher than the mean of 6.6842 ug/m³.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 36

ASOS surface meteorological observations recorded light wind speeds around 3.0 m/s alongside high relative humidity near 91 percent at 09:55 UTC, limiting horizontal dispersion near the TCEQ monitoring location.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 9 of 36

The tceq NO2 anomaly had a z-score of 6.618576381977915 and was classified as severe.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 10 of 36

At 10:00 UTC on June 3, 2026, a TCEQ monitoring station located at coordinates (29.583, -95.016) recorded a severe NO2 concentration anomaly of 9.1 ppb, compared to an expected baseline value of 1.63 ppb.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 11 of 36

NOAA GFS model estimates showed a shallow planetary boundary layer height dropping below 250 meters during the early morning hours of June 3, 2026.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 12 of 36

NOAA GFS model data indicates planetary boundary layer heights collapsing below 250 meters during the morning of June 3, 2026, restricting vertical atmospheric mixing and trapping surface-level NO2 emissions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 13 of 36

Across the regional TCEQ monitoring network, 6-hour average NO2 concentrations rose significantly on June 3, 2026, reaching a peak mean of 12.74 ppb between 12:00 and 18:00 UTC.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 36

The air quality anomaly in Houston, Texas is caused by high levels of NO2 particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 15 of 36

The air quality anomaly in Houston, Texas on June 3rd was caused by a combination of factors including high PM2.5 levels and moderate wind speeds.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 36

Light north-northeasterly surface winds advected combustion emissions from industrial and transportation corridors toward the coastal TCEQ monitoring site.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 17 of 36

The moderate wind speeds contributed to the spread and persistence of the air quality anomaly, allowing pollutants to linger in the atmosphere.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 18 of 36

OpenWeather data shows cloud cover exceeding 87 percent in the morning of June 3, 2026, suppressing the photolytic degradation mechanisms that typically deplete ambient NO₂.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 19 of 36

ASOS weather stations in the Houston region observed light surface wind speeds averaging around 3.0 m/s and high relative humidity near 88% around 10:00 UTC on June 3, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 20 of 36

A local fresh combustion plume near the anomalous TCEQ NO2 monitor is supported by the monitor-specific contrast because the anomalous monitor measured 9.1 ppb at 2026-06-03T10:00:00+00:00 against a site mean of 2.858 ppb while the network-wide TCEQ NO2 mean over the period was 7.4483 ppb and co-located ozone at the same time was only 0.016 ppm, a pattern consistent with freshly emitted NO titration rather than regionally aged air.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 36

The tceq NO2 anomaly had an observed value of 9.1 ppb compared with an expected value of 1.6324324324324324 ppb.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 36

A shallow planetary boundary layer during the early morning hours restricted vertical dispersion, causing surface accumulation of nitrogen dioxide measured by TCEQ.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 23 of 36

The NO₂ anomaly recorded at 10:00 UTC on June 3, 2026, produced a z-score of 6.62 relative to baseline expectations.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 24 of 36

Morning meteorology near the anomaly featured very high humidity, extensive cloud cover, and a relatively shallow planetary boundary layer, which would favor reduced vertical dilution of near-surface NO₂.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 25 of 36

Short-range transport from industrial or ship-channel emission areas is a plausible cause of the NO₂ anomaly because surface winds near the event were from northeasterly to easterly directions while the affected monitor is in eastern Houston, allowing advection of an NO_x plume from nearby source corridors toward the site.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 26 of 36

The TCEQ NO2 monitor at the anomaly location recorded 9.1 ppb at 2026-06-03T10:00:00+00:00 versus an expected 1.63 ppb, which is most consistent with a monitor-scale fresh NOx plume rather than a regionally uniform enhancement.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 36

The air quality anomaly is related to PM2.5 levels.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 28 of 36

A severe NO2 anomaly of 9.1 ppb was detected by a TCEQ surface monitoring station in Houston at 10:00 UTC on June 3, 2026, exceeding the expected baseline of 1.63 ppb.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 29 of 36

The PM2.5 levels were elevated due to the presence of pollutants in the atmosphere, likely originating from industrial or vehicular sources.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 30 of 36

Transport from nearby industrial or ship-channel combustion sources is plausible but not strongly confirmed because low-level winds near the anomaly were northeasterly at about 20 to 32 degrees around the event, which could advect emissions toward the eastern Houston site, but sulfur and broad regional combustion indicators were weak with TCEQ SO₂ only 0.5 ppb at 10:00 UTC and sentinel5p SO₂ near zero on the nearest overpass.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 31 of 36

The anomaly is caused by a nearby industrial facility releasing excessive amounts of particulate matter into the atmosphere.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 36

The anomaly occurred on June 3rd, around 10:00 AM CDT, and was located approximately 8.161 km from the query point.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 36

Suppressed dispersion is a plausible cause of the NO₂ anomaly because humidity near the event was very high, morning cloud cover was extensive, and modeled planetary boundary layer height remained low, conditions that favor accumulation of primary NO₂ near the surface.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 36

The air quality anomaly in Houston, Texas is caused by high levels of PM_{2.5} particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 35 of 36

High morning cloud cover and early-day light conditions limited solar photolysis, slowing the chemical loss of surface nitrogen dioxide.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 36 of 36

A severe thunderstorm or tornado event has stirred up pollutants and particles from the ground, contributing to the air quality anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
