

AERIS Expert Review Packet

Anomaly

Source / metric	openaq / ozone
Observed / expected	0.101 / 0.0185629
Time	2026-07-04 23:00 UTC
Location	29.7681, -95.2206
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	9 / 869	36.74 to 100; mean 72.1848	59.35 at 2026-07-04 22:55Z; dt 5 min
asos	temperature	degC	9 / 869	22.7778 to 36.6667; mean 29.5219	33 at 2026-07-04 22:55Z; dt 5 min
asos	wind_direction	degree	9 / 1166	0 to 360; mean 143.756	170 at 2026-07-04 22:55Z; dt 5 min
asos	wind_speed	m/s	9 / 1201	0 to 9.77444; mean 2.2445	8.2311 at 2026-07-04 22:55Z; dt 5 min
noaa_gfs	gh_500	m	9 / 108	5903.97 to 5930.15; mean 5918.46	5916.99 at 2026-07-05 00:00Z; dt 60 min
noaa_gfs	pbl_height	m	9 / 108	11.4652 to 2081.56; mean 769.689	1199.55 at 2026-07-05 00:00Z; dt 60 min
noaa_gfs	precipitable_water	mm	9 / 108	39.7061 to 52.0889; mean 45.1575	50.5099 at 2026-07-05 00:00Z; dt 60 min
noaa_gfs	surface_pressure	hPa	9 / 108	1006.56 to 1016.78; mean 1012.86	1011.87 at 2026-07-05 00:00Z; dt 60 min
noaa_gfs	t_850	degC	9 / 108	17.3943 to 20.6923; mean 19.1897	19.6205 at 2026-07-05 00:00Z; dt 60 min
noaa_gfs	u_10m	m/s	9 / 108	-2.73237 to 3.62264; mean 0.3918	-1.43237 at 2026-07-05 00:00Z; dt 60 min
noaa_gfs	v_10m	m/s	9 / 108	0.184915 to 5.71323; mean 2.1941	4.76577 at 2026-07-05 00:00Z; dt 60 min
openaq	ozone	ppm	17 / 1127	-0.004 to 0.101; mean 0.0174	0.101 at 2026-07-04 23:00Z; dt 0 min

Event-nearest wind vectors from stored values (arrow points downwind)

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 35

At the time of the ozone anomaly on July 4, 2026, near-surface meteorological observations recorded elevated temperatures reaching 33.0 °C to 35.03 °C alongside southerly winds.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 35

The PM2.5 levels are elevated at 6.7 ug/m3, which is higher than the mean of 8.018 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 35

Light southerly surface winds and a declining late-afternoon planetary boundary layer restricted atmospheric dispersion, concentrating ozone near the surface around 23:00 UTC.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 35

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5 particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 35

Ground-based ambient monitors and satellite column observations confirmed the presence of nitrogen dioxide and formaldehyde precursors necessary to fuel localized photochemical ozone production.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 35

The openaq ozone dataset within 50 km from 2026-07-03T11:00:00+00:00 to 2026-07-06T11:00:00+00:00 had a mean of 0.0174 ppm and a maximum of 0.101 ppm, with the maximum occurring at the anomalous sensor reading.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 35

A decrease in planetary boundary layer height from approximately 1879 meters around 18:00 UTC to 911 meters by 00:00 UTC trapped photochemically generated ozone near the surface, exacerbating local ground-level concentrations.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 35

A severe thunderstorm or tornado event in the Houston area has stirred up dust and debris, contributing to the air quality anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 35

Hot afternoon temperatures near 33 to 35 degC, relatively low afternoon humidity, no precipitation, partial sunshine, and a deep daytime boundary layer favored strong photochemical ozone production in Houston at the time of the anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 35

Southerly to south-southeasterly winds of roughly 5 to 8 m/s were capable of transporting an aged ozone-rich urban-industrial plume toward the eastern Houston anomaly site during late afternoon on 2026-07-04.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 11 of 35

On July 4, 2026 at 23:00 UTC, surface ozone concentrations at the Houston sensor spiked to an anomalous high of 0.101 ppm compared to an expected baseline of 0.0186 ppm.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 12 of 35

High ambient temperatures reaching over 36 degC observed by surface weather networks on July 4 provided strong thermal and photochemical conditions conducive to rapid atmospheric ozone formation in the Houston region.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 13 of 35

The planetary boundary layer height contracted from approximately 1879 meters at 18:00 UTC to around 911 meters by 00:00 UTC, trapping ozone near the surface.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 35

Regional meteorology in eastern Houston at 2026-07-04 23:00 UTC strongly supported photochemical ozone production because surface temperatures were near 33 to 35 C, humidity had dropped to roughly 52 to 59 percent in the afternoon, cloud cover was only about 42 percent near the event, and boundary-layer height was elevated near 1200 m after much deeper afternoon mixing earlier in the day.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 15 of 35

The anomaly occurred on July 4th, 2026, at approximately 23:01:55+00:00.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 35

Eastern Houston transport at 2026-07-04 23:00 UTC was consistent with delivery of an aged urban-industrial plume because surface winds near the anomaly were from roughly 160 to 170 degrees at about 5 to 8 m/s.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 17 of 35

A monitor-scale local enhancement or measurement artifact is a plausible contributor because the openaq ozone peak of 0.101 ppm at sensor 2039 was highly isolated relative to the surrounding network and was not accompanied by elevated nearby NO₂, CO, SO₂, PM_{2.5}, or PM₁₀.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 18 of 35

The ozone anomaly at location (29.768, -95.221) at 2026-07-04T23:00:00+00:00 had an expected value of 0.01856291390728477 ppm and a z-score of 6.554339250396881, and the anomaly severity was classified as severe.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 19 of 35

Peak afternoon air temperatures in the area reached between 33.9°C and 35.0°C on July 4, 2026, facilitating rapid photochemical production of ground-level ozone.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 20 of 35

Nitrogen dioxide precursor emissions provided the necessary baseline reactants for photochemically generated ozone accumulation across the Houston industrial and urban corridor.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 35

The air quality anomaly in Houston, Texas is likely caused by a combination of factors including high levels of PM2.5 and NO2 emissions from industrial activities and vehicle traffic.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 35

The air quality anomaly is caused by a nearby industrial facility releasing excessive amounts of particulate matter and volatile organic compounds.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 23 of 35

The ozone anomaly is most consistent with a localized aged photochemical plume rather than fresh combustion, smoke, or a sulfur-rich industrial release because ozone reached 0.101 ppm while nearby co-pollutants remained low, including NO₂ near 1.7 ppb, CO near 0.2 ppm, SO₂ near 0.0 ppb, PM_{2.5} near 6 to 7 ug/m³, PM₁₀ near 24 ug/m³, and satellite SO₂ and CO columns without unusual enhancement.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 24 of 35

An ozone concentration spike of 0.101 ppm was detected at coordinates (29.768, -95.221) on 2026-07-04 at 23:00:00 UTC, substantially exceeding the expected baseline of approximately 0.0186 ppm with a z-score of 6.55.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 25 of 35

A monitor-scale local enhancement or measurement artifact remains plausible because the openaq ozone peak of 0.101 ppm at the anomalous site was far above the network mean for the same 6-hour period while nearby co-pollutants were not concurrently elevated, with TCEQ NO₂ near 1.7 ppb, TCEQ CO near 0.2 ppm, TCEQ SO₂ near 0.0 ppb, and PM_{2.5} remaining low at nearby openaq and purpleair sensors.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 26 of 35

Transport of an aged urban-industrial plume into eastern Houston at the anomaly time is supported by southerly to south-southeasterly flow of about 5 to 8 m/s near the event, which is consistent with advection from the Houston Ship Channel and broader urban core toward the eastern Houston receptor.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 35

The air quality anomaly in Houston, Texas is caused by high levels of SO₂ particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 28 of 35

The temperature and wind speed data suggest that the air quality anomaly was exacerbated by a heatwave and stagnant atmospheric conditions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 29 of 35

Houston-area meteorology at 2026-07-04 23:00 UTC favored strong ozone production and persistence because afternoon temperature was about 33 C, relative humidity was only about 59 to 70 percent near the anomaly, cloud cover was about 42 percent, and boundary-layer height was about 1200 m near the event time.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 30 of 35

The air quality anomaly in Houston, Texas is caused by high levels of NO2 particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 31 of 35

The anomaly is due to a combination of factors including high temperatures, humidity, and stagnant atmospheric conditions, which have led to the formation of ground-level ozone and other pollutants.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 35

The CO, NO2, and SO2 concentrations were significantly higher than normal levels during the 6-hour period preceding the anomaly, indicating a potential source of pollution.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 35

The pollutant showing the anomaly is ozone, measured at 0.101 ppm at 2026-07-04T23:00:00+00:00 at location (29.768, -95.221).

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 35

High surface temperatures exceeding 33 °C during the afternoon of July 4 enhanced photochemical reaction rates that drive daytime ground-level ozone formation in Houston.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 35 of 35

The air quality anomaly is related to PM2.5 levels.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
