

AERIS Expert Review Packet

Anomaly

Source / metric	openaq / ozone
Observed / expected	0.075 / 0.0170443
Time	2026-08-02 18:00 UTC
Location	29.5203, -95.3925
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	7 / 704	20.95 to 100; mean 69.3142	42.53 at 2026-08-02 17:55Z; dt 5 min
asos	temperature	degC	7 / 704	23.8889 to 37; mean 30.2672	34.6111 at 2026-08-02 17:55Z; dt 5 min
asos	wind_direction	degree	7 / 882	0 to 360; mean 179.456	0 at 2026-08-02 17:55Z; dt 5 min
asos	wind_speed	m/s	7 / 917	0 to 33.4389; mean 2.906	0 at 2026-08-02 17:55Z; dt 5 min
noaa_gfs	gh_500	m	8 / 104	5876.33 to 5946.41; mean 5902.25	5888.01 at 2026-08-02 18:00Z; dt 0 min
noaa_gfs	pbl_height	m	8 / 104	41.0403 to 2539.72; mean 808.846	2407.74 at 2026-08-02 18:00Z; dt 0 min
noaa_gfs	precipitable_water	mm	8 / 104	27.6341 to 57.7464; mean 39.9068	34.901 at 2026-08-02 18:00Z; dt 0 min
noaa_gfs	surface_pressure	hPa	8 / 104	1004.02 to 1013.29; mean 1008.98	1008.5 at 2026-08-02 18:00Z; dt 0 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 36

Hot and dry afternoon meteorology strongly supports enhanced local photochemical ozone production in central Houston, because surface temperature near the anomaly reached about 35 °C while relative humidity fell to roughly 43–47% and regional precipitable water dropped to about 35 mm during the event window.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 36

The air quality anomaly in Houston, Texas is caused by a combination of high temperatures and wind direction.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 36

The air quality anomaly in Houston, Texas is characterized by elevated levels of PM2.5 and NO2.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 36

The PM2.5 levels are elevated at 12.5 ug/m3, which is above the mean of 10.5843 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 36

Weak and variable near-surface winds support stagnation or recirculation as a contributor to the ozone spike, because the nearest ASOS station reported calm wind at 17:55 UTC, area 10 m winds in gfs were only about 3 m/s with changing flow direction, and surface observations showed inconsistent directions around the anomaly time rather than a strong flushing regime.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 36

Hot, unusually dry afternoon conditions favored rapid photochemical ozone production in Houston at the time of the anomaly, as surface temperature was about 35 to 35.3 C while humidity fell to about 42 to 47 percent near 18Z on 2026-08-02.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 36

Elevated atmospheric formaldehyde column levels reaching 0.0003127 mol/m² on August 2, 2026, indicate abundant volatile organic compound precursors that supported rapid photochemical ozone synthesis.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 36

The temperature and wind direction in the affected area were within normal ranges on August 2nd, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 36

The temperature was unusually high on August 2nd, leading to increased emissions from industrial sources and vehicles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 36

A strong wind pattern on August 2nd brought pollutants from nearby cities into the Houston area, contributing to the anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 11 of 36

Surface ozone concentrations reached a severe anomalous peak of 0.075 ppm in Houston at 18:00 UTC on August 2, 2026, during high afternoon temperatures reaching 35.0 °C to 36.4 °C.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 12 of 36

Elevated atmospheric formaldehyde (HCHO) column densities observed around 18:38 UTC on August 2, 2026, indicate increased availability of volatile organic compound (VOC) precursors for photochemical ozone synthesis.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 13 of 36

The combination of high temperatures and stagnant air patterns on August 2nd led to a buildup of pollutants in the Houston area, causing the anomaly.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 14 of 36

The openaq ozone network within 50 km had a 6-hour mean ozone concentration of 0.05994 ppm for 2026-08-02 18Z, compared with 0.0239 ppm for 2026-08-02 12Z.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 15 of 36

Sentinel-5P satellite retrievals recorded a peak formaldehyde column concentration of 0.0003127 mol/m² on August 2, 2026, indicating elevated precursor volatile organic compound levels that fueled ozone production.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 36

High ambient surface temperatures reaching up to 37°C and decreased cloud cover during afternoon hours on August 2, 2026, accelerated photochemical reactions responsible for ground-level ozone formation.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 17 of 36

Houston co-pollutant observations on 2026-08-02 are more consistent with VOC-rich urban-industrial ozone chemistry than with a fresh combustion, sulfur, or smoke event because TCEQ NO₂ and SO₂ near the anomaly were low, PM_{2.5} and PM₁₀ were not strongly elevated, Sentinel-5P HCHO and CO were elevated while Sentinel-5P SO₂ was not elevated, and Sentinel-5P NO₂ was not unusually high.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 18 of 36

The air quality anomaly in Houston, Texas is not caused by CO levels.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 19 of 36

Surface weather observations from ASOS and OpenWeather at 18:00 UTC on August 2, 2026, indicated ambient temperatures exceeding 35 degrees Celsius and relative humidity levels between 37% and 42%.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 20 of 36

The openaq ozone anomaly at 29.520, -95.392 had an expected value of 0.017044303797468352 ppm and a z-score of 5.762711911484322 at 2026-08-02T18:00:00+00:00, which is labeled severe in the provided data.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 36

There is no evidence of any significant industrial or agricultural activities that could have contributed to the air quality anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 36

Weak and variable near-surface winds likely promoted stagnation or short-range recirculation that allowed ozone and its precursors to accumulate over central Houston near the time of the anomaly.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 23 of 36

The air quality anomaly is related to PM2.5 levels.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 24 of 36

Houston surface ozone on 2026-08-02 18:00Z is most consistent with a daytime photochemical production event because area ozone increased sharply to a 6-hour mean near 0.05994 ppm while surface temperature was about 35 to 36 C and humidity fell to roughly 37 to 47 percent.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 25 of 36

The precursor and co-pollutant pattern supports VOC-rich urban-industrial photochemistry more than a fresh combustion plume or smoke/dust event, because ozone was high while local NO₂ remained low near 2.3 ppb, PM₁₀ and PM_{2.5} were not elevated, satellite HCHO and CO were somewhat elevated, and satellite SO₂ showed no corresponding enhancement.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 26 of 36

Ambient surface temperatures exceeding 35 degrees Celsius alongside relative humidity dropping below 40 percent around 18:00 UTC on August 2, 2026, created optimal photochemical conditions for rapid ozone formation in Houston.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 36

The precursor signature is most consistent with VOC-driven urban-industrial photochemistry rather than a fresh NO_x or SO₂ plume, because ozone and formaldehyde were elevated while nearby NO₂, SO₂, and CO were not elevated at the anomaly time.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 28 of 36

Sentinel-5P satellite measurements at approximately 18:38 UTC on August 2, 2026, observed an elevated tropospheric formaldehyde column density of approximately 0.000313 mol/m² across the regional domain.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 29 of 36

Stagnant surface winds averaging under 3 m/s and localized calm wind conditions restricted regional pollutant ventilation, promoting surface ozone accumulation.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 30 of 36

ASOS surface wind observations near the anomaly site recorded near-calm winds of 0.0 m/s around 17:55 UTC on August 2, 2026, favoring localized precursor stagnation prior to peak ozone generation.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 31 of 36

The openaq monitor at 29.520, -95.392 recorded an ozone concentration of 0.075 ppm at 2026-08-02T18:00:00+00:00.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 36

Houston meteorology on 2026-08-02 18:00Z favored ozone accumulation and precursor processing because local winds were weak or variable, one nearby ASOS observation reported calm wind, and GFS showed a deep afternoon boundary layer near 2408 m under relatively low precipitable water near 34.9 mm.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 36

Weak surface wind speeds below 3 m/s combined with deep planetary boundary layer growth on August 2, 2026, created local atmospheric stagnation that facilitated ozone accumulation near the surface.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 36

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 35 of 36

OpenAQ recorded a severe ozone anomaly reaching 0.075 ppm against an expected value of 0.017 ppm at coordinates (29.520, -95.392) on August 2, 2026, at 18:00 UTC.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 36 of 36

The anomaly occurred on August 2nd at around 18:01 UTC, with a nearest sensor located approximately 24.318 km away from the anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
