

AERIS Expert Review Packet

Anomaly

Source / metric	openaq / pm10
Observed / expected	87 / 22.6522
Time	2026-06-07 05:00 UTC
Location	29.7690, -95.3179
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	9 / 640	61.34 to 100; mean 85.4038	94.29 at 2026-06-07 04:55Z; dt 5 min
asos	temperature	degC	9 / 640	23.8889 to 31.6667; mean 27.2583	27 at 2026-06-07 04:55Z; dt 5 min
asos	wind_direction	degree	9 / 640	0 to 360; mean 139.922	160 at 2026-06-07 04:55Z; dt 5 min
asos	wind_speed	m/s	9 / 640	0 to 10.8033; mean 3.6333	5.65888 at 2026-06-07 04:55Z; dt 5 min
noaa_gfs	gh_500	m	11 / 132	5853.96 to 5892.69; mean 5871.17	5868.98 at 2026-06-07 06:00Z; dt 60 min
noaa_gfs	pbl_height	m	11 / 132	44.2979 to 1425.04; mean 610.514	491.034 at 2026-06-07 06:00Z; dt 60 min
noaa_gfs	precipitable_water	mm	11 / 132	47.8843 to 59.8974; mean 55.3793	56.2208 at 2026-06-07 06:00Z; dt 60 min
noaa_gfs	surface_pressure	hPa	11 / 132	1001.91 to 1012.88; mean 1008.07	1008.52 at 2026-06-07 06:00Z; dt 60 min
noaa_gfs	t_850	degC	11 / 132	17.231 to 20.0187; mean 18.6295	18.9874 at 2026-06-07 06:00Z; dt 60 min
noaa_gfs	u_10m	m/s	11 / 132	-4.43892 to 1.30517; mean -1.2812	-0.910293 at 2026-06-07 06:00Z; dt 60 min
noaa_gfs	v_10m	m/s	11 / 132	0.345771 to 6.69698; mean 3.0687	3.00933 at 2026-06-07 06:00Z; dt 60 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 36

Marine aerosol or salt-rich coarse particle transport from the Gulf is a plausible contributor to the Houston PM10 anomaly because surface winds were consistently from the southeast to south-southeast near 150 to 166 degrees during a very humid period, indicating sustained onshore flow into the urban area.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 36

High ambient relative humidity exceeding 92 percent near 05:00 UTC on June 7, 2026, promoted hygroscopic growth of atmospheric aerosols, increasing measured PM10 mass.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 36

The air quality anomaly in Houston, Texas is caused by high levels of CO.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 36

High relative humidity recorded by asos and openweather near 94 percent facilitated hygroscopic particle growth, increasing aerosol mass concentrations measured by openaq sensors.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 36

At 2026-06-07T05:00:00+00:00 near the anomaly location, openaq PM2.5 was 25.4 ug/m3, openaq ozone was 0.01 ppm, tceq CO was 0.1 ppm, tceq NO2 was 3.5 ppb, and tceq SO2 was -0.2 ppb.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 36

The air quality anomaly in Houston, Texas is characterized by elevated levels of PM2.5.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 36

A local coarse-particle source such as road dust, construction material, industrial bulk handling, or other mechanically generated dust is supported because openaq PM10 at the anomaly site rose to 87 ug/m3 while PM2.5 at the same site was only 25.4 ug/m3 and regional PM2.5 was much lower near 6 ug/m3, which indicates a particle-size distribution weighted toward coarse material rather than a broadly mixed fine-particle episode.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 36

ASOS surface observations recorded high relative humidity above 90 percent and persistent southerly winds during the anomaly, promoting hygroscopic growth of suspended particulates.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 36

The wind direction at the time of the anomaly was around 166.0 degrees.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 36

Regional 6-hour average PM10 concentrations measured by openaq sensors increased from 13.17 ug/m3 on June 6 to a peak of 51.06 ug/m3 during the 06-07 06Z window.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 11 of 36

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 12 of 36

The temperature inversion caused by the high-pressure system over the Gulf of Mexico led to a stagnation of air, resulting in poor air quality.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 13 of 36

The air quality anomaly in Houston, Texas is likely caused by a combination of factors including industrial activities and vehicle emissions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 36

A reduced nocturnal planetary boundary layer height of approximately 447 to 491 meters restricted vertical atmospheric dispersion, trapping particulate emissions near the ground.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 15 of 36

The presence of pollutants from industrial activities and vehicle emissions in the Houston area contributed to the poor air quality.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 36

The wind direction and speed, which were not favorable for dispersing pollutants, also played a role in the poor air quality.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 17 of 36

Resuspended road dust or construction-related dust is a leading hypothesis for the Houston PM10 anomaly because PM10 rose sharply to 87 $\mu\text{g}/\text{m}^3$ while nearby PM2.5 increased much less strongly and gaseous combustion tracers remained low, which matches a coarse-particle-dominant source signature.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 18 of 36

The temperature at the time of the anomaly was around 26.62°C.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 19 of 36

The Houston PM10 spike was likely inflated but not fully explained by humidity because local PM2.5 also increased while nearby PurpleAir PM2.5 showed a regional overnight rise.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 20 of 36

The air quality anomaly in Houston, Texas is caused by low wind speeds.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 36

The openaq PM10 6-hour mean increased from 13.17 ug/m3 during 2026-06-06 18Z to 40.83 ug/m3 during 2026-06-07 00Z and 51.06 ug/m3 during 2026-06-07 06Z, indicating that elevated PM10 persisted across multiple hours around the anomaly time.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 36

An OpenAQ ground sensor detected a severe PM10 concentration spike of 87.0 ug/m3 in Houston at 05:00 UTC on June 7, 2026, concurrent with increased fine particulate levels across the PurpleAir sensor network.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 23 of 36

Sustained southerly to southeasterly surface winds observed by asos and openweather transported regional coarse particulate matter into the Houston metropolitan area, elevating PM10 levels across openaq monitoring networks.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 24 of 36

A PM10 concentration anomaly of 87.0 ug/m³, against an expected value of approximately 22.65 ug/m³ (z-score 5.56), was detected at coordinates (29.769, -95.318) on June 7, 2026 at 05:00 UTC.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 25 of 36

Nighttime boundary-layer confinement likely amplified near-surface PM10 concentrations in Houston because the anomaly occurred under high humidity and a relatively shallow planetary boundary layer of about 491 m, which would favor accumulation of locally emitted or transported particles before daytime mixing increased.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 26 of 36

The air quality anomaly in Houston, Texas is also characterized by elevated levels of NO₂.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 36

Humidity-related measurement enhancement remains plausible but not sufficient as a sole explanation because the event occurred with very high relative humidity near 94 to 95 percent, cloud cover was extensive, and nighttime boundary-layer height was only about 491 m, yet the PM10 increase was much larger than the concurrent PM2.5 increase and nearby PurpleAir PM2.5 did not show a comparably extreme spike.

Mark exactly one:	☐ V	☐ I	☐ U
--------------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 28 of 36

At the exact time of the PM10 anomaly, the local openaq PM2.5 reading reached 25.4 ug/m3 at the same location, coinciding with elevated regional 6-hour mean PM2.5 levels of up to 10.39 ug/m3 reported by purpleair.

Mark exactly one:	☐ V	☐ I	☐ U
--------------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 29 of 36

The Houston meteorological setting near 2026-06-07T05:00:00+00:00 favored nighttime accumulation and transport of coarse particles because humidity was about 94 to 95 percent, winds were from the southeast at about 3.7 to 5.7 m/s, and modeled planetary boundary layer height was about 491 m.

Mark exactly one:	☐ V	☐ I	☐ U
--------------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 30 of 36

NOAA GFS reanalysis data showed a shallow nocturnal planetary boundary layer height dropping below 450 meters during the early morning of June 7, 2026, trapping particulates near the surface.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 31 of 36

Sustained southerly to southeasterly surface winds transported regional airborne particulate matter into Houston, elevating regional PM10 levels across multiple monitoring sensors.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 36

The openaq PM10 measurement at 29.769, -95.318 in Houston was 87.0 ug/m3 at 2026-06-07T05:00:00+00:00, compared with an expected value of 22.652173913043477 ug/m3, yielding a z-score of 5.564932313403645 and a severe anomaly classification.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 36

The Houston anomaly is most consistent with a local coarse-particle non-combustion event because PM10 reached 87 ug/m3 while ozone, NO2, CO, and SO2 stayed low near the anomaly time.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 36

Nocturnal boundary layer compression recorded by gfs and light surface winds observed by asos constrained atmospheric mixing, trapping ground-level coarse particulates and causing the openaq PM10 concentration spike.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 35 of 36

A combustion-dominated plume is contradicted because co-located or nearby combustion tracers remained low during the PM10 spike, with ozone near 0.01 ppm, TCEQ CO near 0.1 ppm, TCEQ NO2 near 3.5 ppb, and TCEQ SO2 near background or negative values, which is not the pattern expected for a strong fresh combustion event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 36 of 36

The air quality anomaly is related to particulate matter (PM2.5) with a value of 6.0 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
