

AERIS Expert Review Packet

Anomaly

Source / metric	tceq / co
Observed / expected	0.4 / 0.143114
Time	2026-06-19 19:00 UTC
Location	29.6697, -95.1285
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	7 / 468	56.38 to 100; mean 83.8526	63.01 at 2026-06-19 18:55Z; dt 5 min
asos	temperature	degC	7 / 468	23 to 35; mean 28.542	33 at 2026-06-19 18:55Z; dt 5 min
asos	wind_direction	degree	7 / 467	0 to 340; mean 135.61	190 at 2026-06-19 18:55Z; dt 5 min
asos	wind_speed	m/s	7 / 468	0 to 8.74555; mean 3.4164	5.14444 at 2026-06-19 18:55Z; dt 5 min
noaa_gfs	gh_500	m	8 / 96	5867.19 to 5918.16; mean 5895.21	5910.07 at 2026-06-19 18:00Z; dt 60 min
noaa_gfs	pbl_height	m	8 / 96	64.9563 to 1814.28; mean 615.639	1635.88 at 2026-06-19 18:00Z; dt 60 min
noaa_gfs	precipitable_water	mm	8 / 96	40.017 to 59.8281; mean 50.5666	50.8807 at 2026-06-19 18:00Z; dt 60 min
noaa_gfs	surface_pressure	hPa	8 / 96	1002.08 to 1012.77; mean 1008.14	1010.39 at 2026-06-19 18:00Z; dt 60 min
noaa_gfs	t_850	degC	8 / 96	18.3317 to 23.2907; mean 20.2516	18.517 at 2026-06-19 18:00Z; dt 60 min
noaa_gfs	u_10m	m/s	8 / 96	-3.27924 to 1.58572; mean -1.2137	0.269746 at 2026-06-19 18:00Z; dt 60 min
noaa_gfs	v_10m	m/s	8 / 96	-1.84918 to 5.8484; mean 2.9406	4.38859 at 2026-06-19 18:00Z; dt 60 min
openaq	ozone	ppm	16 / 1066	-0.001 to 0.049; mean 0.02	0.031 at 2026-06-19 19:00Z; dt 0 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 36

Localized industrial or heavy combustion activities near monitor 482011039 generated a localized elevation in ground-level carbon monoxide reaching 0.4 ppm at 19:00 UTC on June 19, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 36

A carbon monoxide concentration of 0.4 ppm was recorded at TCEQ monitor 482011039 in Houston at 19:00 UTC on June 19, 2026, representing a severe statistical anomaly relative to expected baseline values.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 36

Daytime boundary layer heights exceeding 1500 meters rapidly diluted the plume regionally, constraining the severe carbon monoxide footprint to the immediate vicinity of the local TCEQ monitor.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 36

The CO, SO₂, and O₃ levels were also elevated during the air quality anomaly, indicating potential contributions from industrial activities and vehicle emissions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 36

ASOS weather station reports and GFS atmospheric models indicated moderate south-southeasterly surface winds around 3.8 to 5.1 m/s and a daytime planetary boundary layer height exceeding 1500 meters during the anomaly period.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 36

The air quality anomaly in Houston, Texas is caused by high levels of PM_{2.5} particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 36

The elevated carbon monoxide measurement at 19:00 UTC represented a z-score of approximately 5.19 above the expected value.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 36

Sentinel-5P satellite observations near the anomaly site recorded a carbon monoxide total column density of approximately 0.0278 mol/m² at 19:04 UTC on June 19, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 36

A transient low-level transport or fumigation contribution is supported because surface winds near the anomaly time were predominantly from the south to south-southeast at about 3.9 to 5.1 m/s while the boundary layer was deep at about 1636 m, which would permit advection of an upwind plume to the monitor without requiring strong local stagnation.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 36

The anomaly occurred on June 19th at approximately 19:01:49 UTC, with the nearest sensor located 1.625 km away.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 11 of 36

The tceq carbon monoxide anomaly occurred at monitor 482011039, which has a mean carbon monoxide concentration of 0.1466 ppm over the provided context window and was the nearest monitor to the anomaly location at 0.0 km.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 12 of 36

South to south-southeasterly low-level flow likely transported emissions toward the anomaly site at the event time, because nearby surface winds were predominantly from about 158 to 190 degrees with moderate speeds around 3.9 to 5.1 m/s, placing emission sources located to the south or south-southeast of the monitor in the most plausible upwind sector.

Calm-wind flag: wind direction unstable under calm conditions. openweather: event wind 1.34 m/s, below its cutoff of 1.5 m/s (mean - 2*SD gave -0.3003492113671715 m/s; n=361 wind readings). Cutoff floor: confirmed 2026-07-24.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 13 of 36

The temperature and wind direction data suggest that the air quality anomaly was influenced by a heatwave event with stagnant atmospheric conditions.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 36

South-southeasterly surface winds averaging 3.8 m/s to 5.1 m/s transported upwind industrial or traffic emissions directly toward the monitoring location.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 15 of 36

The tceq carbon monoxide monitor at 29.670, -95.129 measured 0.4 ppm at 2026-06-19T19:00:00+00:00, compared with an expected value of 0.1431137724550898 ppm, corresponding to a z-score of 5.187155188286583 and a severe anomaly classification.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 36

A nearby primary combustion source such as on-road traffic, diesel equipment, marine activity, rail operations, or industrial flaring is the leading physical cause of the Houston CO spike because the CO increase at the anomaly monitor was large while co-located NO₂ and SO₂ remained low and regional particulate levels were not concurrently elevated, which is consistent with a localized CO-rich plume rather than a broad secondary pollution event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 17 of 36

Sentinel-5P satellite observations indicated standard regional total column carbon monoxide values around 0.0278 mol/m², confirming the surface anomaly was a localized ground-level event.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 18 of 36

A severe carbon monoxide anomaly was recorded on June 19, 2026, at 19:00 UTC at coordinates (29.670, -95.129) with a concentration of 0.4 ppm compared to an expected baseline of 0.143 ppm.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 19 of 36

A localized primary combustion plume is supported because the anomaly-site CO reached 0.4 ppm while co-located NO₂ was only 1.7 ppb and co-located SO₂ was 0.2 ppb, which is more consistent with a nearby CO-rich source than with a broad urban traffic or sulfur-bearing plume at the monitor.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 20 of 36

The anomaly is caused by a nearby industrial facility releasing excessive amounts of particulate matter into the atmosphere.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 21 of 36

Regional observations do not support a broad combustion or sulfur-rich event because Sentinel-5P carbon monoxide column near the anomaly time was about 0.0278 mol/m² without enhancement, sulfur dioxide column was near zero or negative, and nearby particulate matter and ozone were not unusually high at the anomaly site.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 22 of 36

TCEQ ambient air monitoring data showed minimal concurrent sulfur dioxide levels (0.2 ppb) and low nitrogen dioxide concentrations (1.7 ppb) at the site during the carbon monoxide peak.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 23 of 36

The air quality anomaly is related to particulate matter (PM_{2.5}) with a value of 6.7 ug/m³.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 24 of 36

The Houston TCEQ monitor 482011039 recorded a severe local carbon monoxide spike of 0.4 ppm at 2026-06-19T19:00:00+00:00 against an expected value of 0.143 ppm, while the same monitor reported only 1.7 ppb nitrogen dioxide and 0.2 ppb sulfur dioxide at that time.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 25 of 36

At 2026-06-19T19:00:00+00:00 at the same location, tceq nitrogen dioxide was 1.7 ppb and tceq sulfur dioxide was 0.2 ppb, while openaq ozone at 0.032 km was 0.031 ppm.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 26 of 36

A severe thunderstorm or tornado event occurred in the area, stirring up pollutants and reducing air quality.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 36

The air quality anomaly in Houston, Texas is likely caused by a combination of factors including high levels of PM2.5 and NO2 emissions from industrial activities and vehicle traffic.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 28 of 36

The anomaly is a result of a combination of factors including high temperatures, humidity, and stagnant atmospheric conditions, leading to poor air mixing and increased pollutant concentrations.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 29 of 36

A regional combustion or major petrochemical upset is contradicted because Sentinel-5P showed no elevated CO column over the area, satellite SO₂ remained near zero, and nearby particulate matter was modest to low around the anomaly time rather than strongly elevated as in a large-area smoke or flaring episode.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 30 of 36

Ground-level carbon monoxide observations from TCEQ monitor 482011039 recorded a spike to 0.4 ppm at 19:00 UTC on June 19, 2026, whereas regional Sentinel-5P total carbon monoxide column concentrations showed no corresponding broad elevation.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 31 of 36

Houston-area winds near 2026-06-19T19:00:00+00:00 were predominantly from the south to south-southeast with moderate speed, and modeled boundary-layer height was high near 1636 m, which is consistent with transport and daytime fumigation of a nearby plume rather than stagnant trapping.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 36

Surface meteorological observations during the anomaly period recorded south-southeasterly winds at speeds between 3.8 and 5.1 m/s and a daytime planetary boundary layer height exceeding 1500 meters.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 36

The anomaly is not related to any other pollutants such as CO, NO₂, SO₂, or O₃, as their values are within normal ranges.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 36

Active hydrocarbon emissions in the Houston industrial corridor are a plausible contributing factor because formaldehyde columns were elevated on the same afternoon while satellite CO columns were not regionally enhanced, which is more consistent with localized petrochemical VOC activity or oxidation occurring alongside a surface CO plume than with a metropolitan-scale combustion buildup.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 35 of 36

The air quality anomaly in Houston, Texas is caused by high levels of NO₂ particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 36 of 36

The air quality anomaly in Houston, Texas is caused by high levels of SO₂ particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
