

AERIS Expert Review Packet

Anomaly

Source / metric	tceq / co
Observed / expected	0.4 / 0.127607
Time	2026-06-21 03:00 UTC
Location	29.7337, -95.2576
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event
asos	humidity	percent	9 / 610	59.83 to 100; mean 85.6873	94.16 at 2026-06-21 02:55Z; dt 5 min
asos	temperature	degC	9 / 610	23 to 33.8889; mean 27.5848	24 at 2026-06-21 02:55Z; dt 5 min
asos	wind_direction	degree	9 / 610	0 to 360; mean 131.377	60 at 2026-06-21 02:55Z; dt 5 min
asos	wind_speed	m/s	9 / 610	0 to 9.77444; mean 3.2528	2.05778 at 2026-06-21 02:55Z; dt 5 min
noaa_gfs	gh_500	m	10 / 120	5875.31 to 5915.93; mean 5894.91	5881.55 at 2026-06-21 00:00Z; dt 180 min
noaa_gfs	pbl_height	m	10 / 120	49.5963 to 1845; mean 560.016	212.459 at 2026-06-21 00:00Z; dt 180 min
noaa_gfs	precipitable_water	mm	10 / 120	41.18 to 60.3207; mean 53.1083	53.8544 at 2026-06-21 00:00Z; dt 180 min
noaa_gfs	surface_pressure	hPa	10 / 120	1004.61 to 1012.77; mean 1009.2	1008.42 at 2026-06-21 00:00Z; dt 180 min

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). The labeling guide that comes with this packet has the definitions and marking rules. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Claim 1 of 34

Nitrogen dioxide (NO₂) reached a concentration of 17.3 ppb at the same monitoring site and time as the carbon monoxide anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 2 of 34

Nighttime stagnation and a shallow boundary layer likely amplified near-surface carbon monoxide at the Houston monitor by suppressing dilution and trapping fresh emissions close to the ground.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 3 of 34

The air quality anomaly in Houston, Texas is characterized by elevated levels of PM_{2.5} and NO₂.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 4 of 34

Emission transport from sources east to northeast of the Houston monitor was a plausible contributor because local winds were light and predominantly from about 60 to 85 degrees during the anomaly period, which would advect plumes from the ship channel, industrial corridor, port, or nearby traffic corridors toward the site.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 5 of 34

A shallow nocturnal planetary boundary layer and low surface wind speeds suppressed atmospheric mixing, causing primary pollutants to accumulate near the surface.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 6 of 34

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5 particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 7 of 34

The Houston carbon monoxide anomaly at 2026-06-21T03:00:00+00:00 is most consistent with nighttime trapping of local primary combustion emissions under weak winds and a shallow boundary layer.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 8 of 34

Low regional PM2.5 levels from OpenAQ and PurpleAir alongside steady Sentinel-5P total column CO measurements indicate that large-scale wildfire smoke transport or regional pollution events were unlikely.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 9 of 34

The air quality anomaly in Houston, Texas is caused by high levels of NO2 particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 10 of 34

Meteorological observations near 2026-06-21T03:00:00+00:00 showed very humid and weak-wind conditions near the anomaly location, including 94.16 percent humidity and 2.057776 m/s wind speed from asos and 95 percent humidity and 0.89 m/s wind speed from openweather.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 11 of 34

NOAA GFS model outputs and ASOS weather station observations indicated a shallow nocturnal boundary layer height below 200 meters and light surface winds around 2026-06-21T03:00:00Z.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 12 of 34

A severe thunderstorm or tornado event has stirred up dust and pollutants from the city's infrastructure, contributing to the air quality anomaly.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 13 of 34

The source direction for the Houston carbon monoxide anomaly is most plausibly from the east to northeast of the monitor because nearby surface winds were light and from about 60 to 85 degrees at the anomaly time.

Calm-wind flag: wind direction unstable under calm conditions. openweather: event wind 0.89 m/s, below its cutoff of 1.5 m/s (mean - 2*SD gave -0.43149306530293385 m/s; n=360 wind readings). Cutoff floor: confirmed 2026-07-24.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 14 of 34

The anomaly occurred on June 21st at approximately 03:00:20+00:00, with the nearest sensor located 0.6 km away.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 15 of 34

Meteorological data from ASOS, OpenWeather, and GFS show very shallow planetary boundary layer heights below 200 meters and weak surface winds under 2 m/s around 03:00 UTC on June 21, 2026, supporting nocturnal atmospheric trapping.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 16 of 34

The PM2.5 levels are elevated at 8.1 ug/m3, which is above the mean of 8.3517 ug/m3.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 17 of 34

The air quality anomaly in Houston, Texas is caused by high levels of SO2 particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 18 of 34

The anomaly is caused by a nearby industrial facility releasing excessive amounts of particulate matter into the atmosphere.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 19 of 34

The localized accumulation of carbon monoxide in Houston was driven by nocturnal atmospheric trapping of primary combustion emissions.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 20 of 34

Nighttime stagnation and shallow mixing strongly support boundary-layer trapping as a cause of the Houston carbon monoxide anomaly because winds near the anomaly were light at about 0.89 to 2.06 m/s, humidity was about 94 to 95 percent, and GFS planetary boundary layer height was only about 212 m near 00Z and about 140 to 187 m in the surrounding 6-hour period.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 21 of 34

The anomaly is a result of a combination of factors including high temperatures, low humidity, and stagnant atmospheric conditions, leading to an accumulation of pollutants in the atmosphere.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 22 of 34

The pollutant pattern at the Houston monitor at 2026-06-21T03:00:00+00:00 shows fresh combustion influence because carbon monoxide was elevated, nitrogen dioxide was elevated to 17.3 ppb, and ozone was 0.0 ppm.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 23 of 34

At 2026-06-21T03:00:00+00:00, carbon monoxide (CO) reached 0.4 ppm at coordinates (29.734, -95.258), significantly above the expected concentration of 0.128 ppm with a z-score of 5.10.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 24 of 34

The temperature on June 21, 2026 was relatively low, with a mean value of 24.16°C.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 25 of 34

Regional wildfire smoke or a sulfur-rich industrial plume is not strongly supported as the main cause of the Houston carbon monoxide anomaly because nearby PM2.5 was only about 6.6 to 8.1 ug/m3, PM10 was about 21 ug/m3, sulfur dioxide at the colocated monitor was about -0.1 ppb, and the later Sentinel-5P sulfur dioxide column was not elevated.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 26 of 34

The air quality anomaly is related to PM2.5 levels.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 27 of 34

The tceq carbon monoxide measurement at 29.734, -95.258 was 0.4 ppm at 2026-06-21T03:00:00+00:00, compared with an expected value of 0.12760736196319017 ppm, corresponding to a z-score of 5.095711951734264 and a severe anomaly classification.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 28 of 34

The TCEQ monitoring station in Houston recorded a carbon monoxide concentration of 0.4 ppm and a nitrogen dioxide concentration of 17.3 ppb at 2026-06-21T03:00:00Z.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 29 of 34

Fresh local combustion emissions likely contributed to the carbon monoxide anomaly because carbon monoxide and nitrogen dioxide were elevated while ozone was near zero, a pattern consistent with recent primary emissions under nocturnal conditions.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 30 of 34

The wind direction and speed were not significantly different from the average values for the region.

Mark exactly one:☐ V☐ I☐ U**Note:**

Claim 31 of 34

TCEQ ground monitoring recorded a simultaneous increase in nitrogen dioxide concentrations to 17.3 ppb alongside carbon monoxide at 03:00 UTC on June 21, 2026, supporting a localized primary combustion source hypothesis.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 32 of 34

Localized combustion emissions from vehicular traffic or industrial sources near the monitoring site produced coincident elevated concentrations of carbon monoxide and nitrogen dioxide.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 33 of 34

The nearest openaq ozone measurement at the anomaly location was 0.0 ppm at 2026-06-21T03:00:00+00:00, while the nearest tceq nitrogen dioxide measurement at the same location and time was 17.3 ppb.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Claim 34 of 34

Fresh local combustion supports the Houston carbon monoxide anomaly because the anomaly coincided with elevated local nitrogen dioxide at 17.3 ppb and very low ozone near 0.0 ppm, which is consistent with recently emitted combustion plumes under nighttime ozone titration rather than daytime secondary production.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note:

Optional: most likely cause

Your best guess at the true cause of this event, in your own words. "Insufficient evidence to determine a single cause" is a perfectly fine answer.
