

AERIS Expert Review Packet

Anomaly

Source / metric	tceq / Carbon monoxide (co)
Observed / expected baseline	0.4 / 0.105405 ppm
Baseline method	mean of the preceding 7 days of this series (Z-score detector)
Time	2026-07-30 19:00 UTC
Location	29.6697, -95.1285
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

The three tables in this section are look-up tables. You never have to read them through: they are here for the moment a claim quotes a number and you want to check it.

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). To skip a claim, leave all three boxes blank; a blank is recorded as missing and never turned into Unsure. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Label definitions, from the labeling guide

Valid (V): the claim holds up at the precision it states, and the evidence in the packet supports it.

Invalid (I): the evidence in the packet contradicts the claim, the claim misstates a measurement, or the physical reasoning does not hold.

Unsure (U): you cannot tell from what is shown. This covers thin evidence, measurements that cannot resolve the claim, ambiguous wording, and anything outside what you are comfortable judging.

Missing or thin evidence means Unsure, not Invalid.

A cause that is plausible but unproven stays Unsure unless the evidence actually contradicts it.

Some claims bundle several statements into one sentence. Judge those by their parts. If every part earns the same verdict, use that verdict.

Claim 1 of 36

Note (optional):

Claim 7 of 36

A local primary combustion plume is supported because the TCEQ CO monitor at 29.670, -95.129 measured 0.4 ppm at 2026-07-30T19:00:00+00:00 versus an expected 0.105 ppm, while co-located TCEQ NO2 was only 1.3 ppb, co-located TCEQ SO2 was 0.1 ppb, nearby OpenAQ PM2.5 was 8.2 ug/m3, nearby OpenAQ PM10 was 22 ug/m3, and nearby OpenAQ ozone was 0.033 ppm rather than showing a parallel spike in multiple pollutants.

Mark exactly one:

Note (optional):

Claim 8 of 36

Heavy vehicular traffic emissions along nearby transportation corridors, such as State Highway 225, contributed directly to the elevated carbon monoxide concentrations recorded at the surface.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 9 of 36

A nearby fresh combustion source such as on-road traffic, diesel equipment, marine or rail activity, or an industrial combustion plume is the leading physical explanation for the sharp CO enhancement because the TCEQ CO monitor at the anomaly site reached 0.4 ppm while colocated NO₂ was only 1.3 ppb, SO₂ was 0.1 ppb, PM_{2.5} was 8.2 ug/m³, PM₁₀ was 22 ug/m³, and ozone was 0.033 ppm, which is consistent with a localized CO-rich plume rather than a broad regional pollution episode.

Mark exactly one:

☐ V

Note (optional):

Claim 10 of 36

The localized peak in surface carbon monoxide of 0.4 ppm recorded by TCEQ monitor 482011039, contrasted with baseline total column atmospheric CO concentrations measured by Sentinel-5P, points to a primary ground-level emission source near the monitor.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 11 of 36

Meteorological transport from a source to the south or southeast of the monitor is supported because the nearest ASOS station reported 140 degree wind direction and 2.06 m/s wind speed within 5 minutes of the anomaly, the ASOS 18Z mean wind direction was about 181 degrees, and GFS 10 m winds near the site were positive u and v at 18Z, indicating southerly to southeasterly flow capable of carrying a narrow plume across the monitor.

Claim 12 of 36

The tceq carbon monoxide value of 0.4 ppm at 2026-07-30T19:00:00+00:00 at monitor 482011039 exceeded the mean carbon monoxide level of 0.1188 ppm for that monitor over the provided context window.

Claim 16 of 36

Light surface wind speeds under 4 m/s restricted horizontal dispersion, facilitating the localized buildup of carbon monoxide emissions near the surface.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 17 of 36**

The PM2.5 levels exceeded the normal range in Houston, Texas on July 30th, with a peak value of 1.625 ug/m3 at sensor 128007.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 18 of 36**

The TCEQ monitor at 29.670, -95.129 measured a severe local CO spike of 0.4 ppm at 2026-07-30T19:00:00+00:00 against an expected value near 0.105 ppm, while the same site measured only 1.3 ppb NO2 and 0.1 ppb SO2 at that time.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 19 of 36

The PM_{2.5} levels are elevated due to nearby industrial activities or wildfires.

Mark exactly one:

Claim 20 of 36

Surface weather observations from ASOS stations recorded light south-southeasterly winds under 4 m/s during the anomaly window, which restricted local atmospheric dispersion.

Mark exactly one:

Note (optional):

Claim 21 of 36

Surface and boundary-layer meteorology near Houston at the anomaly time supported transport of a narrow plume from the south to southeast toward the monitor rather than regional accumulation, because nearby observed winds were about 140 degrees at 2.06 m/s and modeled daytime planetary boundary layer height was about 1709 m.

Mark exactly one:

The temperature anomaly is caused by a heatwave.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 24 of 36**

Local surface wind speeds were measured between 2.0 and 3.8 m/s while the boundary layer height reached approximately 1650 to 1700 meters during the afternoon of July 30, 2026.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 25 of 36**

The NO₂ levels were also elevated in Houston, Texas on July 30th, with a peak value of 22.7 ppb at monitor 482011039.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 26 of 36

Local meteorology could have allowed a narrow source plume to intersect the monitor at 19 UTC because surface conditions were hot and relatively dry with light-to-moderate winds near the site, with ASOS reporting about 34 C, 49.74 percent humidity, wind from 140 degrees at 2.06 m/s near the anomaly time, while GFS showed southerly low-level flow and a daytime planetary boundary layer near 1709 m that would favor advection of a discrete plume rather than stagnant nighttime accumulation.

Note (optional):

Claim 28 of 36

A large regional smoke or urban-scale accumulation event is less likely as the primary cause of the CO spike because satellite CO column near Houston on 2026-07-30 was only modestly elevated relative to adjacent days, satellite SO₂ and NO₂ columns were not strongly enhanced, and local particle measurements remained low to moderate rather than showing the widespread PM increase expected from regional smoke.

Claim 29 of 36

The air quality anomaly in Houston, Texas is not caused by changes in wind direction or speed.

Mark exactly one:

Note (optional):

Claim 30 of 36

Regional stagnation or a large area combustion episode is contradicted because GFS planetary boundary layer height near the site was about 1709 m at 18Z, surface winds were not calm in ASOS and OpenWeather observations, Sentinel-5P CO column near the site was only 0.02744 mol/m² without an obvious jump relative to adjacent days, and particle measurements from OpenAQ and PurpleAir were not broadly elevated at the anomaly time.

Mark exactly one:

☐ V☐ I☐ U

Claim 31 of 36

Low co-located nitrogen dioxide concentrations observed by TCEQ alongside modest fine particulate matter readings from OpenAQ and PurpleAir indicate that the carbon monoxide anomaly was not caused by a major regional combustion or wildfire event.

At the exact time of the carbon monoxide anomaly, adjacent air quality monitoring recorded an ozone concentration of 0.033 ppm and a PM2.5 concentration of 8.2 ug/m3.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 33 of 36**

The PM2.5 levels are elevated at 1.1 ug/m3, which is higher than the mean of 8.1319 ug/m3.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 34 of 36**

Industrial combustion or process flaring at petrochemical facilities along the Houston Ship Channel corridor released a localized carbon monoxide plume, causing the TCEQ monitor to record 0.4 ppm at 19:00 UTC on July 30, 2026.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 35 of 36

The carbon monoxide concentration at the monitor location reached 0.4 ppm compared to an expected baseline of approximately 0.105 ppm, corresponding to a z-score of 8.55.

The air-quality pattern near 29.670, -95.129 at 2026-07-30 19:00 UTC is most consistent with a short-lived local combustion plume because nearby ozone was 0.033 ppm, nearby PM10 was 22 ug/m3, nearby PM2.5 was 8.2 ug/m3, and broader regional PM2.5 remained modest rather than showing a coincident widespread smoke or aerosol event.
