

AERIS Expert Review Packet

Anomaly

Source / metric	openaq / Ozone (ozone)
Observed / expected baseline	0.063 / 0.0156194 ppm
Baseline method	mean of the preceding 7 days of this series (Z-score detector)
Time	2026-06-28 23:00 UTC
Location	29.7681, -95.2206
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

The three tables in this section are look-up tables. You never have to read them through: they are here for the moment a claim quotes a number and you want to check it.

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). To skip a claim, leave all three boxes blank; a blank is recorded as missing and never turned into Unsure. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Label definitions, from the labeling guide

Valid (V): the claim holds up at the precision it states, and the evidence in the packet supports it.

Invalid (I): the evidence in the packet contradicts the claim, the claim misstates a measurement, or the physical reasoning does not hold.

Unsure (U): you cannot tell from what is shown. This covers thin evidence, measurements that cannot resolve the claim, ambiguous wording, and anything outside what you are comfortable judging.

Missing or thin evidence means Unsure, not Invalid.

A cause that is plausible but unproven stays Unsure unless the evidence actually contradicts it.

Some claims bundle several statements into one sentence. Judge those by their parts. If every part earns the same verdict, use that verdict.

Claim 1 of 35

The openaq sensor at 29.768, -95.221 recorded ozone of 0.063 ppm at 2026-06-28T23:00:00+00:00.

Claim 11 of 35

Prevailing southeasterly surface winds transported nitrogen dioxide and other chemical precursors across the region toward the anomaly site.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 12 of 35**

Meteorology near eastern Houston at the anomaly time favored strong ozone production because air temperatures were about 32–33 C, cloud cover was 0%, precipitation was absent, surface winds were from the south to southeast at roughly 3.6–6.7 m/s, and GFS boundary-layer height near 00Z was about 1407 m.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 13 of 35**

Regional photochemical ozone production is strongly supported because eastern Houston was hot, nearly cloud-free, and dry enough for efficient photochemistry at the anomaly time, with about 32 to 33.1 degrees Celsius temperature, about 59 to 65 percent relative humidity, zero precipitation, and 0 percent cloud cover near 23:00 UTC on 2026-06-28.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 14 of 35

Deep vertical mixing within a daytime planetary boundary layer reaching over 1,700 meters facilitated the photochemical accumulation of surface ozone prior to the evening boundary layer transition.

Claim 20 of 35

A severe surface ozone anomaly occurred at coordinates (29.768, -95.221) in Houston, Texas, on 2026-06-28 at 23:00:00 UTC.

Mark exactly one:

☐ V☐ I☐ U

Note (optional):

Claim 21 of 35

A fresh primary combustion or sulfur-rich industrial plume is contradicted because the anomaly coincided with low co-pollutant indicators, including carbon monoxide near 0.1 ppm, nitrogen dioxide near 3.4 ppb, sulfur dioxide near -0.2 ppb, and no satellite enhancement of sulfur dioxide or carbon monoxide over the area on the same afternoon.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 22 of 35**

Deep daytime boundary layer mixing exceeding 1700 meters combined with southeasterly winds near 6 m/s facilitated the dispersion and reaction of ozone precursor emissions.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 23 of 35**

Hot temperatures, very low cloud cover, no precipitation, and a deep afternoon boundary layer on 2026-06-28 favored strong photochemical ozone production near eastern Houston.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 24 of 35

Nearby trace-gas observations do not support a fresh combustion or sulfur-rich plume as the dominant cause because contemporaneous TCEQ measurements near the anomaly were about 0.1 ppm CO, 3.4 ppb NO₂, and -0.2 ppb SO₂, so the most likely cause is secondary photochemical ozone formed upwind and transported into eastern Houston.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 25 of 35**

The ozone anomaly is less consistent with a fresh local combustion plume and more consistent with aged photochemical air or recirculated air because CO, NO₂, and SO₂ near the event were low while ozone was strongly elevated.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 26 of 35**

Transport of an ozone-rich precursor-aged air mass into eastern Houston is supported because surface winds near the anomaly were southerly to southeasterly at about 137 to 160 degrees with moderate speeds of about 3.6 to 6.7 meters per second, which is consistent with advection from the Gulf and ship-channel corridor rather than stagnation.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 27 of 35

The anomaly occurred on June 28th, with the highest PM2.5 levels recorded at 23:00:01+00:00.

Note (optional):

Claim 29 of 35

Southerly to southeasterly winds on 2026-06-28 were consistent with transport of ozone and its precursors from the Houston Ship Channel, petrochemical corridor, and coastal urban-industrial areas toward the anomaly location in eastern Houston.
