Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). To skip a claim, leave all three boxes blank; a blank is recorded as missing and never turned into Unsure. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Label definitions, from the labeling guide

Valid (V): the claim holds up at the precision it states, and the evidence in the packet supports it.

Invalid (I): the evidence in the packet contradicts the claim, the claim misstates a measurement, or the physical reasoning does not hold.

Unsure (U): you cannot tell from what is shown. This covers thin evidence, measurements that cannot resolve the claim, ambiguous wording, and anything outside what you are comfortable judging.

Missing or thin evidence means Unsure, not Invalid.

A cause that is plausible but unproven stays Unsure unless the evidence actually contradicts it.

Some claims bundle several statements into one sentence. Judge those by their parts. If every part earns the same verdict, use that verdict.

Claim 19 of 35

Strong daytime photochemical production and accumulation over the Houston urban-industrial air mass likely increased the regional NO₂ background on 2026-06-01 because satellite NO₂ column and HCHO were elevated near the event time and surface ozone was moderately high, even though sulfur dioxide and particulate matter did not indicate a major smoke or sulfur-rich plume.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

A severe nitrogen dioxide anomaly reaching 33.5 ppb was recorded by a TCEQ surface monitor in Houston at 20:00 UTC on June 1, 2026.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 22 of 35

A sulfur-rich industrial upset or regional smoke episode is not strongly supported because SO₂ remained near zero at the nearest TCEQ monitor, Sentinel-5P SO₂ was low near the event time, CO was only moderate at 0.4 ppm, and PM_{2.5} remained only modestly elevated near about 10 to 12 ug/m³.

Mark exactly one:

Note (optional):

Claim 23 of 35

Meteorology near the anomaly time was consistent with transport of emissions from sources east to southeast of the monitor because nearby observations showed easterly winds near 80 to 100 degrees, wind speeds near 3.1 to 3.6 m/s, hot temperatures near 33.9 to 34.0 C, and a deep afternoon boundary layer near 1864 m.

Mark exactly one:

☐ V

Note (optional):

Claim 31 of 35

A fresh local combustion plume is supported because the TCEQ monitor measured an extreme surface NO₂ concentration of 33.5 ppb at 20:00 UTC while nearby winds were easterly to east-southeasterly at about 3 to 4 m/s, a pattern consistent with transport from emission sources located east of the monitor rather than stagnant accumulation.
