Anomaly

Source / metric	openaq / PM2.5 (pm25)
Observed / expected baseline	34.5 / 10.75 ug/m3
Baseline method	mean of the preceding 7 days of this series (Z-score detector)
Time	2026-06-02 14:00 UTC
Location	29.8145, -95.3877
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

The three tables in this section are look-up tables. You never have to read them through: they are here for the moment a claim quotes a number and you want to check it.

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). To skip a claim, leave all three boxes blank; a blank is recorded as missing and never turned into Unsure. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Label definitions, from the labeling guide

Valid (V): the claim holds up at the precision it states, and the evidence in the packet supports it.

Invalid (I): the evidence in the packet contradicts the claim, the claim misstates a measurement, or the physical reasoning does not hold.

Unsure (U): you cannot tell from what is shown. This covers thin evidence, measurements that cannot resolve the claim, ambiguous wording, and anything outside what you are comfortable judging.

Missing or thin evidence means Unsure, not Invalid.

A cause that is plausible but unproven stays Unsure unless the evidence actually contradicts it.

Some claims bundle several statements into one sentence. Judge those by their parts. If every part earns the same verdict, use that verdict.

Claim 1 of 36

Shallow boundary layer height under 50 meters combined with low surface wind speeds trapped localized emissions near the ground surface.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 2 of 36

Regional wildfire smoke or a sulfur-rich industrial emission plume is weakened as an explanation because ozone, CO, NO₂, and SO₂ near the anomaly were low at the event time and sentinel5p showed no elevated CO or SO₂ columns later that day over the area.

Note (optional):

Claim 3 of 36

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5 particles.

Mark exactly one:

☐ V

☐ I

Note (optional):

Claim 4 of 36

The anomaly is caused by a nearby industrial facility releasing excessive amounts of particulate matter into the atmosphere.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 5 of 36

A severe thunderstorm or tornado event has stirred up pollutants and particles from the ground, contributing to the air quality anomaly.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 6 of 36

NOAA GFS model simulations and ASOS surface observations showed a shallow planetary boundary layer height below 50 meters and light wind speeds near 1.5 m/s surrounding the anomaly time.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 7 of 36

On June 2, 2026, at 14:00 UTC, an OpenAQ monitor in Houston (29.815, -95.388) recorded a severe PM2.5 concentration of 34.5 ug/m3, well above the expected value of 10.75 ug/m3 with a z-score of 7.39.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 8 of 36

The anomaly is a result of a combination of factors including high temperatures, low humidity, and stagnant atmospheric conditions, which have led to an accumulation of pollutants in the area.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 9 of 36

Meteorological stagnation and moisture favored temporary accumulation or enhancement of particulate matter because winds near the anomaly were weak at about 1.5 m/s, humidity was high at about 84 to 86 percent, and gfs planetary boundary layer height was extremely low near 48 m around the event time.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 10 of 36

The anomaly occurred on June 2nd at approximately 14:00:00+00:00 (0.0 min away) and is located near sensor 246011 (2.65 km).

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 11 of 36

NO₂ levels were also elevated, with a mean value of 6.7047 ppb, suggesting a potential contribution from nearby industrial activities or vehicle emissions.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 12 of 36

The PM_{2.5} levels exceeded the normal range, with a mean value of 6.437 ug/m³, indicating a significant increase in particulate matter.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 13 of 36

A localized primary PM_{2.5} emission plume near the monitor is a leading hypothesis because the anomalous PM_{2.5} value at the openaq site was not mirrored by the nearest purpleair sensor, indicating strong sub-kilometer spatial heterogeneity consistent with a nearby combustion or industrial particle source.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 14 of 36

The PM_{2.5} levels are elevated at 4.6 ug/m³, which is higher than the mean of 6.437 ug/m³.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 15 of 36

The nearest PurpleAir PM_{2.5} monitor located 2.65 km away recorded a concentration of 4.6 ug/m³ at the time of the anomaly on June 2, 2026, at 14:00 UTC.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 16 of 36

Meteorological conditions near central Houston on 2026-06-02 14:00 UTC were favorable for short-term pollutant buildup because local winds were light at about 1.5 m/s, relative humidity was high at about 84 to 86 percent, and gfs boundary-layer height was extremely low at about 48 m near 12:00 UTC.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 17 of 36

Mechanical resuspension of fine dust or mixed road dust is a plausible hypothesis because PM10 was elevated at the same time as the PM2.5 spike while local winds were light, a pattern consistent with a local coarse-plus-fine particle source affecting one part of the urban area.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 18 of 36

High relative humidity levels exceeding 80% measured by ASOS and OpenWeather during the morning of June 2, 2026, enhanced hygroscopic growth of fine particulate matter.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 19 of 36

High relative humidity exceeding 80 percent promoted hygroscopic growth of fine aerosol particles and localized particle accumulation.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 20 of 36

The air quality anomaly in Houston, Texas is caused by high levels of NO₂ particles.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 21 of 36

At 2026-06-02T14:00:00+00:00 near the anomaly location, openaq ozone was 0.009 ppm, tceq CO was 0.1 ppm, tceq NO₂ was 2.0 ppb, and openaq PM₁₀ at the nearest reporting site was 51.0 ug/m³.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 22 of 36

Meteorological trapping and hygroscopic enhancement likely amplified the measured PM_{2.5} concentration because humidity was high and modeled planetary boundary layer height was extremely low near the event time, favoring poor dispersion and water uptake by aerosol.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 23 of 36

A localized primary particle plume or near-source dust/resuspension event is supported because openaq measured a sharp PM_{2.5} spike to 34.5 ug/m³ at the anomaly location while nearby purpleair remained much lower at 4.6 ug/m³ within 2.65 km, indicating strong spatial heterogeneity consistent with a very local source or instrument-near plume rather than a uniform citywide event.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 24 of 36

A localized industrial or combustion point-source emission near the OpenAQ monitoring site caused the sharp PM_{2.5} spike, which was not observed by adjacent PurpleAir sensors.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 25 of 36

The air quality anomaly is related to PM2.5 levels.

Note (optional):

Claim 27 of 36

The openaq PM2.5 anomaly at 29.815, -95.388 on 2026-06-02 14:00 UTC is most consistent with a localized primary particle source because openaq measured 34.5 ug/m3 at the anomaly site while nearby gaseous co-pollutants remained low at the same time, including CO of 0.1 ppm, NO2 of 2.0 ppb, ozone of 0.009 ppm, and SO2 near zero.

Note (optional):

Claim 29 of 36

On June 2, 2026, at 14:00 UTC, an OpenAQ monitoring station in Houston recorded an elevated PM2.5 concentration of 34.5 $\mu\text{g}/\text{m}^3$ against an expected baseline of 10.75 $\mu\text{g}/\text{m}^3$.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 30 of 36

High surface relative humidity above 83% reported by ASOS and OpenWeather near the time of the anomaly supports aerosol hygroscopic growth as a contributing factor to elevated PM2.5 mass concentrations.

Mark exactly one:

☐ V

☐ I

Note (optional):

Claim 31 of 36

Low PM2.5 readings at surrounding PurpleAir and OpenAQ sensors during the anomaly window indicate that the PM2.5 elevation was isolated to the immediate area of the reporting monitor rather than part of a regional plume.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 32 of 36

An OpenAQ PM10 sensor located 15.436 km from the anomaly recorded an elevated PM10 concentration of 51.0 ug/m3 at 2026-06-02T14:00:00+00:00.

Note (optional):

Claim 35 of 36

Model output from GFS and surface observations from ASOS indicate a shallow planetary boundary layer below 50 meters and light surface winds under 2 m/s around 14:00 UTC, supporting surface boundary layer trapping of fine particulates.

Mark exactly one:

☐ V

Note (optional):

Claim 36 of 36

Regional transported smoke or a large sulfur-rich industrial plume is less supported because sentinel5p showed no contemporaneous enhancement in CO or SO₂ columns over the area and purpleair nearby remained much lower than the anomaly site at about 4.6 ug/m³.
