

AERIS Expert Review Packet

Anomaly

Source / metric	tceq / Nitrogen dioxide (no2)
Observed / expected baseline	22.4 / 3.69302 ppb
Baseline method	mean of the preceding 7 days of this series (Z-score detector)
Time	2026-06-03 22:00 UTC
Location	29.5205, -95.3925
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

The three tables in this section are look-up tables. You never have to read them through: they are here for the moment a claim quotes a number and you want to check it.

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). To skip a claim, leave all three boxes blank; a blank is recorded as missing and never turned into Unsure. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Label definitions, from the labeling guide

Valid (V): the claim holds up at the precision it states, and the evidence in the packet supports it.

Invalid (I): the evidence in the packet contradicts the claim, the claim misstates a measurement, or the physical reasoning does not hold.

Unsure (U): you cannot tell from what is shown. This covers thin evidence, measurements that cannot resolve the claim, ambiguous wording, and anything outside what you are comfortable judging.

Missing or thin evidence means Unsure, not Invalid.

A cause that is plausible but unproven stays Unsure unless the evidence actually contradicts it.

Some claims bundle several statements into one sentence. Judge those by their parts. If every part earns the same verdict, use that verdict.

Claim 1 of 35

A localized fresh-combustion plume is supported because the anomalous TCEQ monitor measured 22.4 ppb NO2 at 2026-06-03T22:00Z while the same site had a period mean of 5.849 ppb and the network 6-hour mean was 13.05 ppb, indicating a site-enhanced spike rather than only a region-wide elevation.

Note (optional):

Claim 2 of 35

Houston meteorological conditions near 2026-06-03T22:00:00+00:00 favored short-term NO2 persistence because humidity and cloud cover were high, light rain was present, surface winds were only modest, and forecast planetary boundary layer height was relatively low to moderate.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 3 of 35

A nearby fresh combustion emission plume from urban traffic, diesel activity, marine or rail operations, or industrial combustion is the most plausible direct cause of the 22.4 ppb surface NO₂ spike at the Houston TCEQ monitor because NO₂ was sharply elevated at the site while ozone remained low and particulate matter remained unremarkable, which is the signature of freshly emitted NO_x rather than aged regional pollution.

Claim 4 of 35

NOAA GFS model output shows the regional planetary boundary layer height collapsing from a 6-hour mean of 610.5 meters at 18:00 UTC to 371.9 meters by 00:00 UTC on June 4, severely limiting vertical pollutant dispersion.

Claim 5 of 35

The air quality anomaly in Houston, Texas on June 3rd was caused by a combination of factors including high temperatures, low wind speeds, and nearby industrial activities.

Note (optional):

Claim 10 of 35

Dense cloud cover exceeding 80 percent and light easterly surface winds near 3 m/s reduced photolysis rates and facilitated local NO₂ accumulation.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 11 of 35

Meteorological support for short-term NO₂ persistence is present because conditions near the anomaly were humid and cloudy with ongoing light rain and only modest boundary-layer dilution, including about 84.6 to 89 percent humidity, about 95 percent cloud cover, about 1.33 mm/h precipitation, and GFS planetary boundary layer height near 324 m around the event window.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 12 of 35

Extensive cloud cover and ongoing precipitation suppressed solar irradiance, reducing NO₂ photolysis rates and allowing NO₂ to accumulate.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 13 of 35

The temperature was unusually low on June 3rd, which may have contributed to the formation of ground-level ozone.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 14 of 35

The air quality anomaly in Houston, Texas is caused by a combination of high temperatures and wind direction.

Claim 15 of 35

The TCEQ NO₂ measurement at location 29.520, -95.393 was 22.4 ppb at 2026-06-03T22:00:00+00:00, while the expected value was 3.6930232558139537 ppb and the reported z-score was 6.33457703104176.

Claim 16 of 35

The air quality was elevated above the mean value of 6.7204 ug/m³ for PM_{2.5} in the surrounding area, with a range of 0.0-40.4 ug/m³.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 17 of 35

The Houston air-quality pattern at 2026-06-03T22:00:00+00:00 is most consistent with a localized fresh-combustion NO_x plume rather than a broad regional pollution event because ozone was low near the anomaly, PM_{2.5} and PM₁₀ were not elevated, CO was only modest, and satellite CO and SO₂ did not indicate a strong coincident regional plume.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 18 of 35

TCEQ ground monitoring data documented an NO₂ concentration spike to 22.4 ppb at 22:00 UTC on June 3, 2026, during a period when the regional 6-hour average NO₂ reached 13.05 ppb.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 19 of 35

A broad regional combustion or sulfur-rich industrial event is contradicted because co-located or nearby indicators did not show corresponding enhancements, with ozone near 0.014 ppm, PM_{2.5} near 5.0 to 7.4 ug/m³, CO near 0.2 ppm, SO₂ near -0.5 ppb, and Sentinel-5P CO columns only modestly elevated rather than extreme.

Claim 30 of 35

Boundary-layer dilution was limited enough to allow a local NO₂ plume to remain concentrated near the surface at the time of the anomaly because Houston-area winds were only light to moderate and GFS planetary boundary layer height near the event was a few hundred meters rather than deeply mixed daytime values above about 1 km.

Mark exactly one:	☐ V	☐ I	☐ U
