Anomaly

Source / metric	tceq / Carbon monoxide (co)
Observed / expected baseline	0.5 / 0.136957 ppm
Baseline method	mean of the preceding 7 days of this series (Z-score detector)
Time	2026-07-29 17:00 UTC
Location	29.7337, -95.2576
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

The three tables in this section are look-up tables. You never have to read them through: they are here for the moment a claim quotes a number and you want to check it.

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). To skip a claim, leave all three boxes blank; a blank is recorded as missing and never turned into Unsure. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Label definitions, from the labeling guide

Valid (V): the claim holds up at the precision it states, and the evidence in the packet supports it.

Invalid (I): the evidence in the packet contradicts the claim, the claim misstates a measurement, or the physical reasoning does not hold.

Unsure (U): you cannot tell from what is shown. This covers thin evidence, measurements that cannot resolve the claim, ambiguous wording, and anything outside what you are comfortable judging.

Missing or thin evidence means Unsure, not Invalid.

A cause that is plausible but unproven stays Unsure unless the evidence actually contradicts it.

Some claims bundle several statements into one sentence. Judge those by their parts. If every part earns the same verdict, use that verdict.

Claim 1 of 36

Sentinel-5P satellite retrievals showed a stable regional CO column density near 0.0265 mol/m2 on July 29, 2026, indicating the anomaly was limited to the surface layer.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 2 of 36

The data contradict a regional smoke or widespread secondary-pollution explanation because sentinel5p showed a relatively low local carbon monoxide column on 2026-07-29 compared with the adjacent days, ozone near the monitor was only 0.018 ppm, and purpleair and openaq fine-particle levels were modest near the event even though one collocated openaq PM10 sensor was high, indicating a near-source coarse or mixed local plume rather than regional smoke.

-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 3 of 36

The PM2.5 levels exceeded the normal range in Houston, Texas on July 29th, indicating a significant increase in particulate matter in the air.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 4 of 36

OpenAQ sensors co-located near the anomaly reported elevated PM10 concentrations reaching 120.0 ug/m3 at 17:00 UTC on July 29, 2026.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 5 of 36

The tceq carbon monoxide measurement of 0.5 ppm at 2026-07-29T17:00:00+00:00 exceeded the expected value of 0.13695652173913042 ppm with a z-score of 6.145967130068515, and the anomaly was labeled severe.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 6 of 36

The anomaly occurred on July 29th at around 17:01:54 UTC, with the nearest sensor located approximately 14.451 km away from the anomaly.

Note (optional):

Claim 7 of 36

TCEQ surface monitors and OpenAQ sensors recorded simultaneous elevations in carbon monoxide reaching 0.5 ppm, PM10 reaching 120 ug/m3, and NO2 reaching 10.5 ppb at 2026-07-29T17:00:00+00:00, supporting a localized industrial or combustion emission source.

Mark exactly one:

☐ V

Note (optional):

Claim 8 of 36

Regional observations do not support a broad wildfire-smoke or region-wide CO buildup event because Sentinel-5P CO column near Houston was not elevated on 2026-07-29, while the anomalous site simultaneously showed elevated NO2 and high local PM10 consistent with a localized fresh combustion plume.

Mark exactly one:

Note (optional):

Claim 9 of 36

The wind direction and speed on July 29th were conducive to the accumulation of pollutants in the area, leading to the observed air-quality anomaly.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 10 of 36

Sentinel-5P satellite observations recorded standard baseline total CO column values of approximately 0.0256 mol/m² over the area, indicating that the TCEQ carbon monoxide spike was isolated to the surface boundary layer rather than a widespread regional plume.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 11 of 36

The tceq carbon monoxide measurement at coordinates (29.734, -95.258) was 0.5 ppm at 2026-07-29T17:00:00+00:00.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 12 of 36

A nearby industrial facility may have released excessive amounts of sulfur dioxide and nitrogen oxides into the atmosphere, causing the air-quality anomaly.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 13 of 36

The air quality in Houston, Texas is poor due to high levels of NO₂.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 14 of 36

Light winds and stable surface microscale conditions prior to full planetary boundary layer expansion contributed to the localized accumulation of primary combustion emissions, as modeled in GFS data.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 15 of 36

Localized industrial combustion or flaring events in eastern Houston released primary pollutants, causing concurrent elevated levels of carbon monoxide, nitrogen dioxide, and particulate matter recorded by TCEQ and OpenAQ sensors.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 16 of 36

A short-lived local combustion source near the Houston monitor, such as industrial process emissions, flaring-related combustion, heavy-duty traffic, or nonroad equipment, is the most plausible physical cause of the severe CO spike because the CO enhancement was large at one TCEQ site while co-pollutants remained only modestly elevated or low at that location.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 17 of 36

Nitrogen dioxide concentration measured 10.5 ppb at the primary anomaly monitor location on July 29, 2026, at 17:00 UTC.

Note (optional):

Claim 19 of 36

Surface meteorology near the anomaly featured southerly to south-southwesterly winds of about 2 to 2.4 m/s and a deep afternoon planetary boundary layer near 2189 m, which supports transport of a nearby plume to the monitor but does not support strong regional stagnation or shallow-trapping accumulation.

Claim 20 of 36

A severe carbon monoxide concentration of 0.5 ppm was recorded at coordinates (29.734, -95.258) on July 29, 2026, at 17:00 UTC, significantly exceeding the expected baseline value of 0.137 ppm.

Mark exactly one:

Note (optional):

Claim 21 of 36

NO₂ levels were also elevated in Houston, Texas on July 29th, suggesting increased emissions from industrial or vehicular sources.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 22 of 36

ASOS surface stations and OpenWeather data reported light south-southwesterly winds around 2.0 m/s during the anomaly, providing weak atmospheric dispersion that allowed localized primary pollutants to accumulate near ground level.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 23 of 36

The temperature was unusually high on July 29th, which could have contributed to the formation of ground-level ozone.

Note (optional):

Claim 26 of 36

Meteorology from asos, openweather, and gfs supports transport of a localized plume rather than strong stagnation because near the anomaly winds were southerly to south-southwesterly at about 190 to 208 degrees with speeds around 2.1 to 2.4 m/s and the afternoon boundary layer was deep at about 2189 m, allowing advection from upwind source areas while not favoring citywide surface accumulation.

Mark exactly one:

Note (optional):

Claim 27 of 36

The tceq carbon monoxide anomaly is consistent with a localized primary combustion plume because the anomalous monitor measured 0.5 ppm at 17:00 UTC while other nearby tceq carbon monoxide monitors within about 15 km had lower period means of 0.1156 to 0.3532 ppm and the coincident tceq nitrogen dioxide value at the same monitor was elevated at 10.5 ppb, which is a typical co-emitted combustion tracer.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 28 of 36

The concentration of PM2.5 is elevated to 8.3 ug/m3, which is above the mean value of 8.0665 ug/m3.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 29 of 36

The pollutant responsible for the anomaly is PM2.5.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 30 of 36

Heavy urban mobile source emissions from surrounding traffic corridors accumulated locally and were transported toward the monitor by light southerly surface winds reported by ASOS and OpenWeather.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 31 of 36

A region-wide CO accumulation event or wildfire-smoke-driven anomaly is less plausible because daytime boundary-layer depth was high, no precipitation-related stagnation signal was present, satellite CO column was not elevated over the area, and surface PM2.5 remained only modestly elevated even though one nearby PM10 sensor was high.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 32 of 36

The TCEQ monitor 482011035 recorded a carbon monoxide concentration of 0.5 ppm at 2026-07-29T17:00:00+00:00, which is a severe positive anomaly relative to the expected value of about 0.137 ppm at that site and time.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 33 of 36

The air-quality anomaly in Houston, Texas on July 29th was caused by a combination of factors including high temperatures, low wind speeds, and nearby industrial activities.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 34 of 36

TCEQ monitor 482011035 recorded a carbon monoxide concentration of 0.5 ppm alongside an NO₂ level of 10.5 ppb at 17:00 UTC on July 29, 2026.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 35 of 36

Coinciding with the carbon monoxide spike on July 29, 2026, at 17:00 UTC, PM₁₀ and PM_{2.5} concentrations reached 120.0 ug/m³ and 15.7 ug/m³ respectively at a location 0.021 km from the anomaly.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 36 of 36

Southerly to south-southwesterly near-surface winds of roughly 2 to 3 m/s at the anomaly time could have transported a localized combustion plume from sources south of the monitor toward the site without producing a broad regional pollution episode.
