Anomaly

Source / metric	tceq / Sulfur dioxide (so2)
Observed / expected baseline	13.5 / -0.393827 ppb
Baseline method	mean of the preceding 7 days of this series (Z-score detector)
Time	2026-06-21 13:00 UTC
Location	29.7337, -95.2576
Severity	severe
Detectors	zscore, stl, isolation_forest

The baseline is a mean of this series' own recent history, so it can fall below zero for a metric the network reports near or below its detection limit.

Stored evidence summary

The three tables in this section are look-up tables. You never have to read them through: they are here for the moment a claim quotes a number and you want to check it.

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). To skip a claim, leave all three boxes blank; a blank is recorded as missing and never turned into Unsure. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Label definitions, from the labeling guide

Valid (V): the claim holds up at the precision it states, and the evidence in the packet supports it.

Invalid (I): the evidence in the packet contradicts the claim, the claim misstates a measurement, or the physical reasoning does not hold.

Unsure (U): you cannot tell from what is shown. This covers thin evidence, measurements that cannot resolve the claim, ambiguous wording, and anything outside what you are comfortable judging.

Missing or thin evidence means Unsure, not Invalid.

A cause that is plausible but unproven stays Unsure unless the evidence actually contradicts it.

Some claims bundle several statements into one sentence. Judge those by their parts. If every part earns the same verdict, use that verdict.

Claim 1 of 36

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5 particles.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 2 of 36

Surface meteorological observations from ASOS near the anomaly location at 12:55:00 UTC on June 21, 2026, indicated south-southeasterly winds of approximately 5.1 m/s and relative humidity reaching 100 percent.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 3 of 36

The anomaly is caused by a nearby industrial facility releasing excessive amounts of particulate matter into the atmosphere.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 4 of 36

The PM_{2.5} levels are elevated, with a mean of 7.612 ug/m³ and a nearest value of 5.6 ug/m³ at 2026-06-21T13:00:00+00:00.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 5 of 36

Meteorological transport and dispersion conditions are consistent with a local plume reaching the monitor because surface winds near the event were southerly to south-southwesterly at roughly 1.8 to 5.1 m/s and the boundary-layer height was only about 323 m near 12Z, which would favor advection from nearby sources with only modest vertical dilution.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 6 of 36

A refinery or petrochemical upset event such as flaring, sulfur recovery unit release, or stack plume interception is a plausible physical cause because the anomaly was extremely localized to one TCEQ sulfur dioxide monitor and occurred under southerly to south-southwesterly low-to-moderate winds that could advect emissions from the Houston Ship Channel industrial corridor toward the site.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 7 of 36

Meteorology and remote sensing are most consistent with a short-duration local industrial SO₂ plume because winds near the event were southerly to south-southwesterly with moderate speeds, gfs showed a relatively shallow boundary layer near 299 to 323 m around 12Z, and sentinel5p later showed no broad SO₂ column enhancement over the area.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 8 of 36

Meteorological trapping was likely a contributing amplifier but not the primary cause because humidity and precipitable water were high and the boundary layer was still relatively shallow near the event time, yet surface winds were not calm and no coincident regional increases appeared in particulate matter or ozone measurements.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 9 of 36

The air quality anomaly in Houston, Texas is caused by high levels of SO₂ particles.

Note (optional):

Claim 10 of 36

NOAA GFS model data indicated a shallow planetary boundary layer height of approximately 323 meters near the anomaly location at 12:00 UTC on June 21, 2026.

Note (optional):

Claim 13 of 36

Local wind flow from the south and southeast transported industrial sulfur emissions toward the monitoring site during the morning hours.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 14 of 36

The anomalous sulfur dioxide value occurred at the same monitor and hour when nearby tceq co was 0.2 ppm and tceq no2 was 0.6 ppb.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 15 of 36

The air quality anomaly in Houston, Texas was characterized by elevated PM2.5 levels.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 16 of 36

The temperature and wind speed data from OpenWeather suggest that the anomaly occurred during a period of relatively calm weather.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 17 of 36

The anomaly occurred on June 21, 2026, with the highest PM2.5 levels recorded between 06Z and 12Z.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 18 of 36

The severe SO2 anomaly reaching 13.5 ppb recorded by TCEQ was localized to a single monitoring station, as regional satellite total column SO2 measurements from Sentinel-5P and surrounding TCEQ ground monitors maintained near-zero baseline levels.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 19 of 36

The CO, NO2, and SO2 levels measured by Sentinel-5P and TCEQ monitors were within normal ranges, indicating that the anomaly was not caused by significant emissions or atmospheric changes.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 20 of 36

The tceq sulfur dioxide measurement at 2026-06-21T13:00:00+00:00 at 29.734, -95.258 was 13.5 ppb, compared with an expected value of -0.39382716049382716 ppb, and the reported z-score was 145.66530461416133 with severity classified as severe.

Note (optional):

Claim 22 of 36

Point-source emissions from industrial and petrochemical facilities along the Houston Ship Channel likely caused the elevated SO2 spike recorded by TCEQ monitors.

Mark exactly one:

Note (optional):

Claim 23 of 36

A severe thunderstorm or tornado event has stirred up pollutants and particles from the ground, contributing to the air quality anomaly.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 24 of 36

NOAA GFS model output indicated a low planetary boundary layer height of approximately 323 meters near the anomaly location at 12:00:00 UTC on June 21, 2026.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 25 of 36

The TCEQ monitoring network recorded a severe sulfur dioxide (SO₂) concentration spike reaching 13.5 ppb at coordinates (29.734, -95.258) on June 21, 2026, at 13:00:00 UTC.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 26 of 36

The air quality anomaly is related to PM_{2.5} levels.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 27 of 36

GFS atmospheric model data showed a reduced planetary boundary layer height near 300 meters during the morning of June 21, 2026, which restricted vertical atmospheric mixing and trapped localized SO₂ emissions near the surface.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 28 of 36

The pollutant with the detected anomaly is sulfur dioxide measured by tceq.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 29 of 36

ASOS surface meteorology recorded high relative humidity near 100 percent and southerly to southeasterly winds averaging 3.8 to 5.5 m/s at the time of the SO₂ spike, supporting potential local transport from nearby industrial sources.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 30 of 36

A short-duration local sulfur-rich industrial plume is strongly supported because the TCEQ SO₂ monitor at the anomaly site measured 13.5 ppb at 2026-06-21T13:00:00+00:00 while the same monitor's expected value was near zero and nearby TCEQ CO and NO₂ at the same site remained low at 0.2 ppm and 0.6 ppb, which matches an isolated SO₂ enhancement rather than a general combustion plume.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 31 of 36

A short-duration sulfur dioxide emission from a nearby industrial combustion or process unit is the most plausible physical cause because the TCEQ sulfur dioxide concentration reached 13.5 ppb at the anomaly monitor while the colocated TCEQ carbon monoxide and nitrogen dioxide remained low, which is consistent with a sulfur-rich plume rather than a broad combustion pollution episode.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 32 of 36

Local co-pollutant measurements do not support a broad combustion or regional haze episode because the colocated TCEQ monitor reported CO of 0.2 ppm and NO₂ of 0.6 ppb at 2026-06-21T13:00:00+00:00 while nearby openaq and purpleair particulate measurements remained modest.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 33 of 36

A broad regional sulfur pollution episode is contradicted by the available regional indicators because satellite SO₂ later on 2026-06-21 did not show a positive column enhancement over the area and particle concentrations near the anomaly time were low to moderate rather than regionally elevated across OpenAQ and PurpleAir sensors.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 34 of 36

The TCEQ monitor at 29.734, -95.258 recorded a sharply isolated SO₂ spike to 13.5 ppb at 2026-06-21T13:00:00+00:00 while the 6-hour mean SO₂ across TCEQ monitors for 06-21 12Z was only 0.4294 ppb.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 35 of 36

The anomaly is a result of a combination of factors including high temperatures, low humidity, and stagnant atmospheric conditions, leading to poor air mixing and accumulation of pollutants.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 36 of 36

TCEQ monitor 482011035 in Houston recorded an SO2 concentration peak of 13.5 ppb at 13:00 UTC on June 21, 2026.
