Anomaly

Source / metric	openaq / PM2.5 (pm25)
Observed / expected baseline	52 / 10.2687 ug/m3
Baseline method	mean of the preceding 7 days of this series (Z-score detector)
Time	2026-06-15 16:00 UTC
Location	29.8145, -95.3877
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

The three tables in this section are look-up tables. You never have to read them through: they are here for the moment a claim quotes a number and you want to check it.

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). To skip a claim, leave all three boxes blank; a blank is recorded as missing and never turned into Unsure. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Label definitions, from the labeling guide

Valid (V): the claim holds up at the precision it states, and the evidence in the packet supports it.

Invalid (I): the evidence in the packet contradicts the claim, the claim misstates a measurement, or the physical reasoning does not hold.

Unsure (U): you cannot tell from what is shown. This covers thin evidence, measurements that cannot resolve the claim, ambiguous wording, and anything outside what you are comfortable judging.

Missing or thin evidence means Unsure, not Invalid.

A cause that is plausible but unproven stays Unsure unless the evidence actually contradicts it.

Some claims bundle several statements into one sentence. Judge those by their parts. If every part earns the same verdict, use that verdict.

Claim 1 of 36

Relative humidity reached 100 percent around the time of the anomaly according to ASOS and OpenWeather observations, facilitating hygroscopic aerosol swelling or localized measurement distortion.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 2 of 36

A localized accumulation mechanism is supported because humidity near the anomaly reached 100 percent at 15:55 UTC, nearby wind speed dropped to 0.0 m/s at 15:55 UTC, and regional boundary-layer height was only about 187 to 238 m around 12 to 18 UTC, all of which favor trapping and amplification of near-surface particles in central Houston.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 3 of 36

Calm surface wind speeds recorded by ASOS stations and low planetary boundary layer height modeled by GFS produced stagnant atmospheric dispersion conditions that limited pollutant ventilation.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 4 of 36

The local Houston meteorology at the anomaly time favored aerosol stagnation and hygroscopic growth because humidity was near saturation and surface winds were very weak while boundary-layer depth was low.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 5 of 36

Ambient relative humidity reaching 100 percent in ASOS and OpenWeather data, combined with much lower PM2.5 concentrations at nearby PurpleAir sensors, supports hygroscopic particle growth or optical sensor humidity interference.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 6 of 36

The openaq central Houston PM2.5 anomaly is most likely a monitor-scale artifact or humidity-amplified local spike rather than a broad regional particulate event.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 7 of 36

The air quality anomaly is related to particulate matter (PM2.5) with a concentration of 5.6 ug/m3.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 8 of 36

Stagnant surface winds recorded by ASOS stations and a low planetary boundary layer height simulated by GFS impaired atmospheric dispersion, promoting the localized accumulation of PM2.5 observed by OpenAQ.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 9 of 36

The anomaly occurred on June 15th, 2026, at approximately 16:00:00 UTC.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 10 of 36

A monitor-specific artifact or humidity-driven overresponse remains credible because the anomalous openaq PM2.5 value was 52.0 ug/m3 at the anomaly location while a nearby purpleair PM2.5 sensor measured only 5.6 ug/m3 at the same time and nearby openaq PM10 was only 31.0 ug/m3, which is weak corroboration for a severe area-wide fine-particle event.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 11 of 36

The location of the anomaly is in the vicinity of grid:center (6.262 km) with a distance of approximately 2.65 km from the nearest sensor.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 12 of 36

Meteorological stagnation and moisture trapping are a plausible cause of elevated local PM2.5 because winds near the anomaly were very weak to calm, relative humidity was about 95 to 100 percent, cloud cover was near 100 percent, precipitable water was high, and modeled boundary-layer height was low, all of which favor poor dispersion and aerosol accumulation in Houston.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 13 of 36

The available co-pollutant pattern does not support a strong combustion or large industrial plume at the anomaly time because nearby ozone was low, PM10 was only moderate, and co-located CO and NO2 were not sharply elevated.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 14 of 36

The anomaly is caused by a nearby industrial facility releasing excessive amounts of particulate matter into the atmosphere.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 15 of 36

The openaq PM2.5 measurement at 29.815, -95.388 in Houston was 52.0 ug/m3 at 2026-06-15T16:00:00+00:00, compared with an expected value of 10.268711656441717 ug/m3, giving a z-score of 9.608890843426831 and severe anomaly classification.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 16 of 36

Hygroscopic particle growth or PM2.5 measurement bias under saturated conditions is a plausible contributor because the anomaly occurred during extremely high humidity and light precipitation conditions, while regional PM2.5 and PM10 did not show a comparably strong increase and colocated combustion tracers were not sharply elevated.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 17 of 36

The nearest contemporaneous gas measurements were openaq ozone at 0.011 ppm 10.034 km from the anomaly location, tceq CO at 0.4 ppm 0.02 km from the anomaly location, tceq NO2 at 7.2 ppb 10.026 km from the anomaly location, and tceq SO2 at -0.5 ppb 15.439 km from the anomaly location, all at 2026-06-15T16:00:00+00:00.

Mark exactly one:

☐ V

☐ I

Note (optional):

Claim 18 of 36

A TCEQ monitor situated 0.02 km from the anomaly location recorded a co-located carbon monoxide concentration of 0.4 ppm at 2026-06-15T16:00:00+00:00.

Mark exactly one:

Note (optional):

Claim 20 of 36

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5 particles.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 21 of 36

The anomaly is a result of a combination of factors including high temperatures, low humidity, and stagnant atmospheric conditions, leading to poor air mixing and increased pollutant concentrations.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 22 of 36

A localized primary emission source near the sensor elevated PM2.5 concentrations measured by OpenAQ alongside concurrently elevated carbon monoxide concentrations recorded by TCEQ.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 23 of 36

The nearest openaq PM10 measurement was 31.0 ug/m3 at 2026-06-15T16:00:00+00:00 and 8.427 km from the anomaly location.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 24 of 36

A localized near-source particulate plume is a plausible cause of the anomalous PM2.5 measurement because the anomalous openaq sensor reported 52.0 ug/m3 while nearby purpleair PM2.5 and nearby openaq PM10 remained much lower at the same time, which is consistent with a very spatially confined source affecting one monitor more than the surrounding network.

Note (optional):

Claim 30 of 36

An OpenAQ sensor in Houston recorded a PM2.5 concentration spike of 52.0 ug/m3 at 16:00 UTC on June 15, 2026, whereas nearby OpenAQ and PurpleAir sensors indicated low background PM2.5 levels.
