Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). To skip a claim, leave all three boxes blank; a blank is recorded as missing and never turned into Unsure. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Label definitions, from the labeling guide

Valid (V): the claim holds up at the precision it states, and the evidence in the packet supports it.

Invalid (I): the evidence in the packet contradicts the claim, the claim misstates a measurement, or the physical reasoning does not hold.

Unsure (U): you cannot tell from what is shown. This covers thin evidence, measurements that cannot resolve the claim, ambiguous wording, and anything outside what you are comfortable judging.

Missing or thin evidence means Unsure, not Invalid.

A cause that is plausible but unproven stays Unsure unless the evidence actually contradicts it.

Some claims bundle several statements into one sentence. Judge those by their parts. If every part earns the same verdict, use that verdict.

Mark exactly one:

☐ V

Note (optional):

Claim 4 of 35

A fresh local NO_x plume from nearby combustion sources such as roadway traffic, industrial equipment, marine activity, or rail operations is a likely physical cause of the 19.5 ppb NO₂ spike because the anomaly was highly localized, ozone at a nearby sensor was low at 0.008 ppm at the same hour, and co-located SO₂ and nearby CO did not show comparably large increases.

Mark exactly one:

Note (optional):

Claim 5 of 35

NOAA GFS model analyses indicated a very shallow planetary boundary layer height below 90 meters around 12:00 UTC on June 1, 2026, which restricted vertical mixing of low-level pollutants.

Claim 8 of 35

Ground-level nitrogen dioxide concentrations measured by TCEQ reached 19.5 ppb at 13:00 UTC on June 1, 2026, aligned with Sentinel-5P satellite observations showing elevated NO2 column densities around 4.08e-05 mol/m².

Mark exactly one:

☐ V

☐ I

Note (optional):

Claim 9 of 35

A broader regional urban-industrial NO₂ enhancement likely contributed background support for the local spike because Sentinel-5P showed elevated Houston-area tropospheric NO₂ later on 2026-06-01, with an NO₂ column near 3.78e-05 mol/m² and a 18Z mean around 4.08e-05 mol/m² that was much higher than the previous day.

Note (optional):

Claim 11 of 35

Sentinel-5P satellite observations indicated an elevated average NO₂ column density of 4.08e-05 mol/m² over the area during the June 1, 2026 18Z window compared to 1.667e-05 mol/m² on May 31.

Note (optional):

Claim 14 of 35

The reported tceq NO₂ anomaly at 2026-06-01T13:00:00+00:00 had an expected value of 4.017241379310344 ppb and a z-score of 9.00539499896256, which is labeled severe.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 15 of 35

Shallow mixing and weak winds are a likely physical cause of the NO₂ buildup because the Houston area had very low morning transport and ventilation near the anomaly time, including ASOS wind speed of 1.54 m/s near 12:55 UTC and GFS planetary boundary layer height near 72 m at 12 UTC.

Mark exactly one:

☐ V

☐ I

Note (optional):

Claim 16 of 35

Note (optional):

Claim 22 of 35

The pollutant mix near the NO₂ spike is most consistent with a fresh local NO_x plume because nearby ozone was low at 0.008 ppm while PM_{2.5} remained modest near 5.8 to 10.4 ug/m³ and nearby CO and SO₂ did not show comparably large increases.

Claim 28 of 35

The local fresh-emission-plume hypothesis is supported because the anomalous TCEQ monitor measured 19.5 ppb NO₂ at 13 UTC while the nearest OpenAQ ozone measurement was only 0.008 ppm at the same time, a combination consistent with recently emitted NO scavenging ozone near the source.

Claim 29 of 35

The stagnation-limited-dilution hypothesis is supported because surface winds near the anomaly were weak at about 1.54 m/s in ASOS observations near 12:55 UTC and the GFS planetary boundary layer height near 12 UTC was only about 72 m, both favoring accumulation of near-surface NO₂.

The broader urban-or-industrial enhancement hypothesis has partial support because Sentinel-5P showed elevated Houston-area NO₂ columns at 18Z on 2026-06-01 relative to 2026-05-31, but the exact 13 UTC spike is not strongly supported as a combustion-rich regional plume because nearby TCEQ CO was only 0.1 ppm and nearby TCEQ SO₂ was only 0.1 ppb at 13 UTC.
