

AERIS Expert Review Packet

Anomaly

Source / metric	tceq / Nitrogen dioxide (no2)
Observed / expected baseline	9.7 / 1.2292 ppb
Baseline method	mean of the preceding 7 days of this series (Z-score detector)
Time	2026-07-11 20:00 UTC
Location	29.5831, -95.0155
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

The three tables in this section are look-up tables. You never have to read them through: they are here for the moment a claim quotes a number and you want to check it.

Source	Metric	Unit	Entities / points	Range; mean	Nearest to event

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). To skip a claim, leave all three boxes blank; a blank is recorded as missing and never turned into Unsure. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Label definitions, from the labeling guide

Valid (V): the claim holds up at the precision it states, and the evidence in the packet supports it.

Invalid (I): the evidence in the packet contradicts the claim, the claim misstates a measurement, or the physical reasoning does not hold.

Unsure (U): you cannot tell from what is shown. This covers thin evidence, measurements that cannot resolve the claim, ambiguous wording, and anything outside what you are comfortable judging.

Missing or thin evidence means Unsure, not Invalid.

A cause that is plausible but unproven stays Unsure unless the evidence actually contradicts it.

Some claims bundle several statements into one sentence. Judge those by their parts. If every part earns the same verdict, use that verdict.

Claim 1 of 36

The combination of high temperatures and stagnant air patterns led to a buildup of pollutants in the Houston area, causing the observed anomaly.

-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 2 of 36

The moderate temperature and low wind speeds contributed to the stagnation of air pollutants, exacerbating the air quality anomaly.

Claim 3 of 36

The air quality anomaly is related to PM2.5 levels.

Claim 4 of 36

Boundary layer heights around 317 meters to 813 meters along with low surface wind speeds around 2.6 to 4.1 m/s limited both vertical mixing and horizontal dispersion during the afternoon period.

Claim 5 of 36

At 2026-07-11T19:55:00+00:00, the surface weather station 10.667 km from the anomaly site recorded a temperature of 30.0 degC and wind speed of 4.12 m/s.

Note (optional):

Claim 6 of 36

The pollutant mix near 2026-07-11T20:00:00+00:00 is most consistent with a fresh local NO_x plume because NO₂ was elevated while nearby CO was about 0.2 ppm, PM_{2.5} was about 2.2 to 3.3 ug/m³, PM₁₀ was about 23 ug/m³, and ozone was about 0.033 ppm rather than showing a broad multi-pollutant regional buildup.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 7 of 36

The meteorology near 2026-07-11T20:00:00+00:00 was compatible with a concentrated local plume reaching the monitor because surface winds were moderate at about 3.4 to 4.1 m/s and the modeled planetary boundary layer height was only about 317 m at 18 UTC, which would allow limited dilution of a nearby emission plume.

Mark exactly one:

☐ V

☐ I

Note (optional):

Claim 8 of 36

The anomaly occurred on July 11th, around 20:01:54 UTC, and was located approximately 21.774 km east and 34.665 km south of the query point.

Claim 9 of 36

A severe nitrogen dioxide anomaly was recorded at location (29.583, -95.016) on 2026-07-11T20:00:00+00:00, reaching a value of 9.7 ppb against an expected baseline of 1.23 ppb with a z-score of 6.17.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 10 of 36**

A nearby combustion source plume is a leading candidate cause because the anomalous TCEQ NO2 monitor reported 9.7 ppb at 2026-07-11T20:00:00+00:00 versus an expected 1.23 ppb while nearby ozone at the same time was only moderate at about 0.033 ppm, a pattern consistent with fresh NOx influence rather than a broad aged ozone episode.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 11 of 36**

Local industrial and traffic combustion emissions from the nearby Houston Ship Channel and Bayport industrial complexes released elevated precursor concentrations, causing the localized NO2 spike recorded by the TCEQ monitor.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 12 of 36

The anomaly is more consistent with a localized NO_x event than with a regional smoke or dust intrusion because particulate matter remained low near the anomaly and no contemporaneous regional combustion enhancement is evident in the available carbon monoxide context.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 13 of 36

The planetary boundary layer height dropped to around 317 meters near the anomaly location at 18:00 UTC on July 11, 2026, trapping local surface emissions.

Mark exactly one:

☐ V

☐ I

Note (optional):

Claim 14 of 36

At the exact time of the nitrogen dioxide anomaly, an ozone measurement of 0.033 ppm was recorded 0.008 km from the anomaly location.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 15 of 36

Meteorology near the anomaly showed only moderate ventilation rather than strong stagnation, with ASOS wind speed near 4.12 m/s at 19:55 UTC and GFS planetary boundary layer height near 317 m at 18:00 UTC, which supports partial trapping of a nearby plume but contradicts an explanation requiring extreme calm or a deeply stagnant boundary layer.

Mark exactly one:

Note (optional):

Claim 16 of 36

The tceq NO2 anomaly at 29.583, -95.016 had an expected value of 1.2291970802919707 ppb and a z-score of 6.169790309830889, which was classified as severe.

Mark exactly one:

☐ V

☐ I

☐ U

Note (optional):

Claim 17 of 36

The co-pollutant pattern supports a fresh NOx-rich plume and contradicts a broad combustion or regional smog event because NO2 was elevated while nearby ozone was only 0.033 ppm, TCEQ CO was 0.2 ppm, TCEQ SO2 was 0.7 ppb, and nearby PM2.5 remained low at 2.2 ug/m3 in openaq and 3.3 ug/m3 in purpleair at the anomaly time.

Mark exactly one:

☐ V

Note (optional):

Claim 18 of 36

Boundary-layer and surface-weather conditions likely contributed to the NO₂ enhancement by limiting vertical dilution relative to a fully mixed afternoon, because gfs placed planetary boundary layer height near 317 m at 18:00 UTC and nearby surface observations showed warm, humid conditions with only moderate winds around 4.1 m/s close to the anomaly time.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 19 of 36**

The nearest openaq ozone observation to 29.583, -95.016 at 2026-07-11T20:00:00+00:00 was 0.033 ppm at a sensor 0.008 km from the anomaly location.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 20 of 36**

Heavy cloud cover exceeding 90 percent reduced solar irradiance, slowing down the photolytic conversion of NO₂ into ozone and allowing NO₂ to accumulate near the surface.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 21 of 36

The temperature was unusually high on July 11th, leading to increased emissions from industrial sources and vehicles.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 22 of 36**

The air quality anomaly in Houston, Texas on July 11th was caused by a combination of factors including high temperatures, low wind speeds, and nearby industrial activities.

Mark exactly one:☐ V☐ I☐ U**Note (optional):****Claim 23 of 36**

A strong wind pattern on July 11th brought pollutants from nearby cities into the Houston area, contributing to the anomaly.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 24 of 36

High cloud cover reaching 98% near 20:00 UTC suppressed NO₂ photolysis rates, favoring NO₂ accumulation over atmospheric breakdown.
