Anomaly

Source / metric	openaq / PM10 (pm10)
Observed / expected baseline	72 / 28.4085 ug/m3
Baseline method	mean of the preceding 7 days of this series (Z-score detector)
Time	2026-08-04 16:00 UTC
Location	29.6700, -95.1285
Severity	severe
Detectors	zscore, stl, isolation_forest

Stored evidence summary

The three tables in this section are look-up tables. You never have to read them through: they are here for the moment a claim quotes a number and you want to check it.

Claims

Mark exactly one box per claim: V (Valid), I (Invalid), or U (Unsure). To skip a claim, leave all three boxes blank; a blank is recorded as missing and never turned into Unsure. Each claim appears exactly once, and the number printed next to it is how I'll refer to that claim if I need to ask you about it.

Label definitions, from the labeling guide

Valid (V): the claim holds up at the precision it states, and the evidence in the packet supports it.

Invalid (I): the evidence in the packet contradicts the claim, the claim misstates a measurement, or the physical reasoning does not hold.

Unsure (U): you cannot tell from what is shown. This covers thin evidence, measurements that cannot resolve the claim, ambiguous wording, and anything outside what you are comfortable judging.

Missing or thin evidence means Unsure, not Invalid.

A cause that is plausible but unproven stays Unsure unless the evidence actually contradicts it.

Some claims bundle several statements into one sentence. Judge those by their parts. If every part earns the same verdict, use that verdict.

Claim 1 of 36

The temperature on August 4th, 2026 was relatively high, with a mean value of 30.47°C, which may have contributed to the air quality anomaly.

Claim 2 of 36

There is no evidence to suggest that any other factors such as wind direction or speed, precipitation, or atmospheric pressure played a significant role in the air quality anomaly.

Claim 3 of 36

Industrial bulk material handling, earthmoving, or construction operations in the Deer Park and Houston Ship Channel industrial sector generated localized coarse particulate emissions observed by openaq and tceq.

Claim 4 of 36

The openaq PM10 measurement at coordinates 29.670, -95.129 was 72.0 ug/m3 at 2026-08-04T16:00:00+00:00, compared with an expected value of 28.41 ug/m3 and a z-score of 4.36, and the anomaly was labeled severe.

Note (optional):

Claim 5 of 36

Longer-range transported dust is a secondary hypothesis because the synoptic pattern was hot and mostly cloud-free, but the available satellite trace-gas columns did not show a corresponding combustion signature and the evidence provided does not specifically demonstrate a regional dust plume over Houston at the anomaly time.

Mark exactly one:

☐ V

Note (optional):

Claim 6 of 36

OpenAQ measurements at the anomaly site recorded a PM10 concentration of 72.0 ug/m3 alongside a concurrent PM2.5 level of 23.8 ug/m3, demonstrating that coarse fraction particles comprised most of the particulate mass.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 7 of 36

The air quality anomaly is related to PM2.5, which is elevated.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 8 of 36

The air quality anomaly in Houston, Texas is likely caused by a combination of factors including high levels of PM2.5 and NO2 emissions from industrial activities and vehicle traffic.

Claim 9 of 36

The anomaly occurred on August 4th, around 16:00 UTC.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 10 of 36

Local mechanically generated dust or resuspended road or construction material is supported because PM10 at the anomaly site reached 72.0 ug/m3 while co-located PM2.5 was only 23.8 ug/m3 and nearby PurpleAir PM2.5 was about 16.0 ug/m3, a pattern more consistent with coarse particles than with a fine-particle combustion plume.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 11 of 36

The Houston anomaly occurred under hot, sunny daytime conditions favorable for dust resuspension and vertical mixing because asos and openweather showed temperatures near 32 C, humidity near 59 to 70 percent, cloud cover near 0 percent, and gfs indicated afternoon planetary boundary layer height near 2075 m.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 12 of 36

Regional advection of coarse crustal aerosols across coastal Texas contributed to elevated baseline coarse particulate matter concentrations measured by openaq and purpleair.

Mark exactly one:	☐ V	☐ I	☐ U
-------------------	----------------------------	----------------------------	----------------------------

Note (optional):

Claim 13 of 36

Resuspended local dust is a leading hypothesis because PM₁₀ rose strongly while nearby PM_{2.5} and co-located combustion tracers remained much lower, a pattern that is more consistent with coarse particles from roads, bare soil, or disturbed surfaces than with smoke or fresh exhaust.

Claim 14 of 36

The PM₁₀ anomaly recorded in Houston at 16:00 UTC on August 4, 2026, was dominated by coarse fraction particulate matter while PM_{2.5} levels remained comparatively low.

Claim 15 of 36

An elevated PM₁₀ concentration of 72.0 ug/m³ was recorded on August 4, 2026, at 16:00 UTC at coordinates (29.670, -95.129), representing a severe anomaly with a z-score of 4.36 relative to an expected baseline of 28.41 ug/m³.

Note (optional):

Claim 16 of 36

The temperature was unusually high on August 4th, leading to increased emissions from industrial sources and vehicles.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 17 of 36

Localized industrial, port, construction, or unpaved-road material handling is a plausible cause because the PM10 enhancement was strong in a sparse PM10 network, the anomaly site had only light-to-moderate winds during a hot daytime period, and those conditions can produce short-lived coarse-particle plumes near sources.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 18 of 36

The PM2.5 levels were higher than usual in the surrounding area, potentially due to increased particulate matter emissions from local sources or distant wildfires.

Claim 19 of 36

The air quality anomaly in Houston, Texas is caused by high levels of NO₂.

Claim 20 of 36

The anomaly time and location were 2026-08-04T16:00:00+00:00 at coordinates 29.670, -95.129 in the Houston, Texas area.

Mark exactly one:

☐ V

Note (optional):

Claim 21 of 36

Local mechanically generated dust or resuspended road or construction material is further supported because the anomaly occurred during hot daytime conditions with low cloud cover and only modest winds, with about 32 C temperature, about 59 percent relative humidity at the nearest ASOS station, 0 percent cloud cover near the event, and wind speeds near 2 to 3 m/s, which are conditions that can dry surfaces and allow localized dust emissions to persist.

Claim 22 of 36

OpenAQ PM10 monitoring in the area recorded 6-hour mean concentrations peaking at 73.56 ug/m3 at 12:00 UTC and 76.56 ug/m3 at 18:00 UTC on August 4, 2026.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 23 of 36

TCEQ monitoring at the nearest station recorded minimal co-pollutant concentrations of 1.2 ppb NO2 and 0.0 ppb SO2 at the time of the event, indicating that localized industrial combustion plumes were unlikely primary drivers.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 24 of 36

Localized wind-blown dust resuspension from unpaved surfaces and dry surface soils driven by daytime heating and surface winds contributed to the PM10 spike recorded by openaq.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 25 of 36

The location of the anomaly is near sensor 128007 (1.624 km) and monitor 482011039 (0.032 km).

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 26 of 36

A strong wind pattern on August 5th may have dispersed pollutants from nearby refineries and industrial areas towards the anomaly location.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 27 of 36

Regional transported smoke or a chemically rich industrial combustion plume is contradicted because ozone, CO, NO₂, and SO₂ were not strongly elevated near the anomaly time and same-day satellite columns for CO, NO₂, HCHO, and SO₂ were not enhanced, although transported mineral dust remains a weaker possibility because PM₁₀ stayed elevated across multiple 6-hour periods and southerly to southeasterly low-level flow was present.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 28 of 36

Low concurrent concentrations of nitrogen dioxide, sulfur dioxide, and carbon monoxide rule out major industrial combustion or fire plumes as the source of the PM₁₀ spike.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 29 of 36

The air quality anomaly in Houston, Texas is caused by high levels of PM2.5.

Claim 30 of 36

At the time of the PM10 anomaly on August 4, 2026, at 16:00 UTC, the nearest PM2.5 sensor recorded a concentration of 23.8 ug/m3, demonstrating that coarse particulate matter composed the majority of the elevated PM10 mass.

Mark exactly one:

Note (optional):

Claim 31 of 36

The Houston anomaly is unlikely to be primarily a combustion plume because nearby gaseous copollutants were not elevated at the anomaly time, with tceq showing CO at 0.2 ppm, NO2 at 1.2 ppb, and SO2 at 0.0 ppb near the site.

Claim 32 of 36

At 2026-08-04T16:00:00+00:00 at the anomaly location, openaq PM2.5 was 23.8 ug/m3, openaq ozone was 0.026 ppm, tceq CO was 0.2 ppm, tceq NO2 was 1.2 ppb, and tceq SO2 was 0.0 ppb.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 33 of 36

The air quality anomaly in Houston, Texas is caused by high levels of CO.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 34 of 36

Daytime planetary boundary layer height exceeding 2000 meters accompanied by warm temperatures and low cloud cover facilitated localized surface dust resuspension.

Mark exactly one:☐ V☐ I☐ U**Note (optional):**

Claim 35 of 36

OpenAQ network data showed broad PM10 elevation across the region with 6-hour mean values reaching 73.56 ug/m3 to 76.56 ug/m3, supporting widespread coarse aerosol advection or dust resuspension rather than a single isolated point source.

Mark exactly one:

Note (optional):

Claim 36 of 36

The Houston anomaly is most consistent with a local mechanically generated coarse-particle source because openaq recorded PM10 at 72 ug/m3 against an expected 28.4 ug/m3 at 2026-08-04T16:00Z while co-located PM2.5 was only 23.8 ug/m3.
